Rosner's Test Results

Notes:

1. This appendix presents statistical outliers within each vertical depth category outlined in Section 4.1, for Level 3 datasets only. Outliers were tested using Rosner's Test for sample sizes greater than or equal to 25 using U.S. Environmental Protection Agency (USEPA) ProUCL Version 4.1.01 (ProUCL) statistical software (USEPA 2011). Appendix C-2 presents the results from the Dixon's Extreme Value Test for sample sizes less than 25.
2. Statistical outlier tests were performed ata 5 percent level of statistical significance
3. Non-detect sample results were excluded from the statistical outlier test.
4. Up to 10 statistical outliers were tested for using Rosner's Test on datasets with sample sizes greater than or equal to 25.
5. Calculated totals are defined in Section 4.1.

Table C-2
Dixon's Extreme Value Test Results

Notes:

1. This appendix presents statistical outliers within each vertical depth category outlined in Section 4.1, for Level 3 datasets only. Outliers were tested using Dixon's Extreme Value Test for sample sizes less than 25 using U.S. Environmental Protection Agency (USEPA) ProUCL Version 4.1.01 (ProUCL) statistical software (USEPA 2011). Appendix C-1 presents the results from the Rosner's Test for sample sizes greater than or equal to 25.
2. Statistical outlier tests were performed at a 5 percent level of statistical significance.
3. Non-detect sample results were excluded from the statistical outlier test.
4. One statistical outlier, "Test Data Value", was tested for with Dixon's Extreme Value Test.
5. Calculated totals are defined in Section 4.1.

LMW = low molecular weight
Max = maximum
Min = minimum
ND = nondetect
PAH = polynuclear aromatic hydrocarbon
PBDE = polybrominated diphenyl ether
PCB = polychlorinated biphenyls
ppb = parts per billion
ppm = parts per million
ppt = parts per trillion
ROS = regression on ordered statistics
SD = standard deviation
SVOC = semivolatile organic compound
TPH = total petroleum hydrocarbon

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3

ppt = parts per trillion
ROS = regression on ordered statistics
SD = standard deviation
SVOC = semivolatile organic compound
TPH = total petroleum hydrocarbon

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3.

Summary Statistics
Newark Bay Study Area - USACE Stratified Sample Data

Abbreviations:

-- not applicable due to frequency of detection
1/2 DL = half the detection limit (e.g., sample reporting limit)
CAS = Chemical Abstracts Service
FOD = frequency of detection (detects / total)
ft bss = feet below sediment surface
GM = geometric mean
GOF = goodness-of-fit
HMW = high-molecular weight
KM = Kaplan-Meier
LMW = low-molecular weight
Max = maximum
Min = minimum
ND = nondetect
PAH = polynuclear aromatic hydrocarbon
PCB = polychlorinated biphenyls
ppb = parts per billion
ppm = parts per million
ppt = parts per trillion
ROS = regression on ordered statistics
SD = standard deviation
SVOC = semivolatile organic compound
TPH = total petroleum hydrocarbon
USACE = U.S. Army Corps of Engineers

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not lognormally distributed.

[6] Distribution assessed by GOF tests at 95% confidence level ($\alpha = 0.05$) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test ($n \leq 50$) or Lilliefors test ($n > 50$).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test ($n \leq 50$) or Lilliefors test ($n > 50$).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3.

2-Mile Extended Area Beyond the Newark Bay Study Area - Arthur Kill

Abbreviations:

CAS - Chemical Abstracts Service
1/2 DL - half the detection limit (e.g., sample reporting limit)
ft bss - feet below sediment surface
FOD - frequency of detection (detects / total)
GM - geometric mean
ppb - parts per billion
ppm - parts per million
ppt - parts per trillion
GOF - goodness-of-fit
KM - Kaplan-Meier
Max - maximum
Min - minimum
-- not applicable due to frequency of detection
NA - not applicable because all concentrations are equal to "0"
ND - nondetect
ROS - regression on ordered statistics
SD - standard deviation
PCN = polychlorinated naphthalene
TPH = total petroleum hydrocarbon
PBDE = polybrominated diphenyl ether

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3.

Abbreviations:

-- not applicable due to frequency of detection
1/2 DL = half the detection limit (e.g., sample reporting limit)
CAS = Chemical Abstracts Service
FOD = frequency of detection (detects / total)
ft bss = feet below sediment surface
GM = geometric mean
GOF = goodness-of-fit
HMW = high-molecular weight
KM = Kaplan-Meier
LMW = low-molecular weight
Max = maximum
Min = minimum
NA = not applicable because all concentrations are equal to "0"
ND = nondetect
PAH = polynuclear aromatic hydrocarbon
PBDE = polybrominated diphenyl ether
PCB = polychlorinated biphenyls
PCN = polychlorinated naphthalene
ppb = parts per billion
ppm = parts per million
ppt = parts per trillion
ROS = regression on ordered statistics
SD = standard deviation
SVOC = semivolatile organic compound
TPH = total petroleum hydrocarbon

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3.

Abbreviations:

-- not applicable due to frequency of detection
1/2 DL = half the detection limit (e.g., sample reporting limit)
CAS = Chemical Abstracts Service
FOD = frequency of detection (detects / total)
ft bss = feet below sediment surface
GM = geometric mean
GOF = goodness-of-fit
HMW = high-molecular weight
KM = Kaplan-Meier
LMW = low-molecular weight
Max = maximum
Min = minimum
ND = nondetect
PAH = polynuclear aromatic hydrocarbon
PBDE = polybrominated diphenyl ether
PCB = polychlorinated biphenyls
PCN = polychlorinated naphthalene
ppb = parts per billion
ppm = parts per million
ppt = parts per trillion
ROS = regression on ordered statistics
SD = standard deviation
SVOC = semivolatile organic compound
TPH = total petroleum hydrocarbon

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3.

Abbreviations:

-- not applicable due to frequency of detection
1/2 DL = half the detection limit (e.g., sample reporting limit)
CAS = Chemical Abstracts Service
FOD = frequency of detection (detects / total)
ft bss = feet below sediment surface
GM = geometric mean
GOF = goodness-of-fit
HMW = high-molecular weight
KM = Kaplan-Meier
LMW = low-molecular weight
Max = maximum
Min = minimum
ND = nondetect
PAH = polynuclear aromatic hydrocarbon
PBDE = polybrominated diphenyl ether
PCB = polychlorinated biphenyls
ppb = parts per billion
ppm = parts per million
ppt = parts per trillion
ROS = regression on ordered statistics
SD = standard deviation
SVOC = semivolatile organic compound
TPH = total petroleum hydrocarbon

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3.

1/2 DL = half the detection limit (e.g., sample reporting limit)
CARP = Contaminant Assessment and Reduction Program
CAS = Chemical Abstracts Service
FOD = frequency of detection (detects / total)
ft bss = feet below sediment surface
GM = geometric mean
GOF = goodness-of-fit
HMW = high-molecular weight
KM = Kaplan-Meier
LMW = low-molecular weight
Max = maximum
Min = minimum
ND = nondetect
PAH = polynuclear aromatic hydrocarbon
PCB = polychlorinated biphenyls
ppb = parts per billion
ppm = parts per million
ppt = parts per trillion
ROS = regression on ordered statistics
SD = standard deviation
SVOC = semivolatile organic compound

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not lognormally distributed.

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3.

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not lognormally distributed.

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3

[9] Organic compounds are normalized to TOC and inorganic compounds are normalized to aluminum.

TPH = total petroleum hydrocarbon

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not lognormally distributed.

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3

[9] Organic compounds are normalized to TOC and inorganic compounds are normalized to aluminum.

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not lognormally distributed.

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n ≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n ≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3

[9] Organic compounds are normalized to TOC and inorganic compounds are normalized to aluminum.

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not lognormally distributed.

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3

[9] Organic compounds are normalized to TOC and inorganic compounds are normalized to aluminum.

[10] The Arthur Kill sample group includes samples from the Elizabeth River, Morses Creek, and Piles Creek.

SVOC = semivolatile organic compound
TOC = total organic carbon
TPH = total petroleum hydrocarbon

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not lognormally distributed.

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3

[9] Organic compounds are normalized to TOC and inorganic compounds are normalized to aluminum.

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not lognormally distributed.

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3

[9] Organic compounds are normalized to TOC and inorganic compounds are normalized to aluminum.

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not lognormally distributed.

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3

[9] Organic compounds are normalized to TOC and inorganic compounds are normalized to aluminum.

Abbreviations:

-- not applicable due to frequency of detection
1/2 DL = half the detection limit (e.g., sample reporting limit)
Al = Aluminum
CARP = Contaminant Assessment and Reduction Program
CAS = Chemical Abstracts Service
Fe = Iron
FOD = frequency of detection (detects / total)
ft bss = feet below sediment surface
GM = geometric mean
GOF = goodness-of-fit
HMW = high molecular weight
KM = Kaplan-Meier
LMW = low molecular weight
Max = maximum
Min = minimum
ND = nondetect
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyls
ppb = parts per billiom
ppm = parts per milliom
ppt = parts per trillion
ROS = regression on ordered statistics
SD = standard deviation
SVOC = semivolatile organic compound
TOC = total organic carbon

Notes:

[1] Total concentrations are based on the sum of detected observations; therefore statistics for totals are based on detected observations.

[2] KM and GOF statistics generated using USEPA ProUCL (v. 4.1.01) software (USEPA, 2011). Remaining statistics generated in MS Access 2010.

[3] When FOD = 100%, the KM statistics are equal to the arithmetic mean and standard deviation of the full dataset.

[4] KM statistics and GOF results only reported for constituents with at least 8 total observations and 5 distinct detected observations (USEPA, 2010).

[5] The GM is a parameter that specifically defines a lognormal distribution and is equal to the anti-log of the mean of the log-transformed values. GM is generally not descriptive of the central tendency for data that are not lognormally distributed.

[6] Distribution assessed by GOF tests at 95% confidence level (α = 0.05) using ProUCL 4.1.01 Left-censored data are evaluated with both detects only and ROS methods (USEPA, 2010).
Normal (N): dataset follows a normal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Gamma (G): dataset follows a gamma distribution, according to the Kolmogorov-Smirnov test.
Lognormal (Ln): dataset follows a lognormal distribution, according to the Shapiro Wilks test (n≤50) or Lilliefors test (n>50).
Nonparametric (NP): dataset does not follow any of the three distributions noted above.

[7] Level = data usability levels. For information about these levels and their applicability, please refer to Section 3 of the report.

[8] This table presents data for each of the 18 select chemicals (where available) identified for focused evaluation in Section 4.3

[9] Organic compounds are normalized to TOC and inorganic compounds are normalized to aluminum.

Recently Deposited

Estimated Depth of 1940 Horizon

Depth to Red Clay

Notes:

1. This figure presents a summary of data for Phase I and Phase II sediment data.
2. Recently deposited is defined as surface sediment locations having beryllium-7 concentrations equal to or greater than 0.5 picocurie per gram.
3. Depths of the estimated 1940 horizon and depths to red clay are from the Deposition Report (Tierra 2011b).
4. Core IDs enclosed within a box indicate co-located Phase I and Phase II cores.
5. For presentation purposes, the Newark Bay Phase I and Phase II location IDs were shortened to the last three characters of the location ID. For example, NB01SED026 was shortened to “026”.
6. The sediment core data are ordered north to south within each geographic area. The bottom figure is a continuation from the top figure. Abbreviations:

    ft bss = feet below sediment surface
    ppm = parts per million
    ppb = parts per billion
    ppt = parts per trillion

    HR = Hackensack River

Appendix G: Box and Whisker Plots

Notes:

1. This figure series presents data for each of the 18 select chemicals identified for focused evaluation in Section 4.3.
2. A diagram of a box and whisker plot is illustrated below.
3. Box and whisker plots for Newark Bay North, Newark Bay Central, and Newark Bay South only show Phase I and Phase II data.
4. Non-detect samples for chemicals were included and shown on the box and whisker plots at the full detection limit. The number of non-detects is indicated in parenthesis for each sample size.
5. Surface sediment data consists of samples from 0 to 0.5 ft bss; mid-depth data consist of samples from 0.5 to 3.5 ft bss; and subsurface data consist of samples >3.5 ft bss.
6. If a chemical was not analyzed for a particular sampling event, a box and whisker plot does not appear in the figure.
