This report provides a summary of the documentation and evaluation of data quality and usability for sediment chemistry data collected during the implementation of the Newark Bay Study Area Phase I Remedial Investigation Work Plan, Revision 1 (Phase I RIWP; Tierra 2005).

1. Data Quality Parameters Overview

To evaluate whether the analytical data obtained were consistent with the objectives of the Phase I RIWP, five data quality parameters were evaluated, including specific data quality criteria assessed during analytical data validation. In the event that the data validation process identified an instance where any of the data quality parameters did not meet the objectives established in the Phase I RIWP, the affected sample results were evaluated in accordance with the data validation protocols specified in Section 8 of the Phase I RIWP and qualified accordingly. A detailed narrative describing each data qualifier applied to specific results can be found within the data validation data assessment narratives prepared for each data package. Per Section 8.1.2 of the Phase I RIWP, fully documented laboratory data packages, validation check lists and validation data assessment narratives are located in the Newark Bay Central Project File. These data validation records can be provided by Tierra Solutions Inc. (Tierra) for review, at the United States Environmental Protection Agency's (USEPA) request.

The five data quality parameters assessed included the following:

- precision;
- accuracy;
- representativeness;
- completeness; and
- comparability.

Each of these data quality parameters, as it relates to the Phase I RIWP program, is discussed below.

1.1 Precision

Precision is the measure of variability between individual sample measurements of the same property under similar conditions. During the Phase I RIWP program, precision was evaluated through the analysis of replicate samples. Two types of replicate samples, field and laboratory duplicates, were analyzed at regular, specified intervals throughout the Phase I RIWP program.

Field duplicates consisted of select samples that were collected in the field at the frequency specified in the Phase I RIWP. These samples were homogenized (except for those to be analyzed for VOCs), split into two distinct samples, and submitted “blind” to the analytical laboratories for analysis (i.e., the sample identification did not reveal the sample with which its field duplicate was associated). Relative percent differences (RPDs) between the field sample results and the field duplicate results provide an estimate of the overall sampling and analytical precision.

Laboratory duplicates are two portions of a single homogeneous sample that are analyzed for the same parameter in order to determine the precision of the analytical system. Two types of laboratory duplicates were performed. Laboratory duplicates without known analyte spikes added were analyzed to monitor laboratory precision for metals and cyanide analyses, while matrix spike and matrix spike duplicate

evaluations were performed to monitor laboratory precision for the remaining analysis types. Laboratory duplicates were analyzed at the frequency specified in the Phase I RIWP. The RPD between results obtained for a given laboratory duplicate pair provides an estimate of analytical precision.

The precision assessment for both field and laboratory duplicate analyses is expressed as the RPD:

$$RPD = \left\{ \frac{(S - D)}{\frac{(S + D)}{2}} \right\} \times 100$$

where: S = original sample concentration
D = duplicate sample concentration

Acceptance criteria for field duplicates are provided in Section 6.7.1.2 of the Phase I RIWP, while acceptance criteria for laboratory duplicates are provided in Section 6.6. Conformance to field and laboratory duplicate frequency requirements, as well as acceptability of the resulting RPD values, were evaluated and considered during data validation.

Although field and laboratory duplicate analyses are used as indicators of relative precision of the sampling and analytical systems, the degree of homogeneity of the contaminants in the sample medium can also affect the reproducibility of a particular measurement. For example, pieces of decayed wood debris, chunks of asphalt, glass, free product, etc. can increase sample heterogeneity and therefore can reduce the field/laboratory technician's ability to create homogeneous duplicate samples with which to measure precision. Since the sediment sample matrix characteristics can affect the way precision is measured, the sample matrix should be considered by the data user.

1.2 Accuracy

Accuracy is a measure of the bias in a system, and is defined as the agreement between a measurement and an accepted reference or true value. Accuracy was monitored during the Phase I RIWP program through the analysis of field blank, laboratory blank, matrix spike (MS), surrogate spikes, and laboratory control samples (performed at regular, specified intervals). In addition, performance evaluation samples were analyzed, for polychlorinated dibenzo-*p*-dioxins/polychlorinated dibenzofurans (PCDDs/PCDFs) only, prior to initiating field work. Documentation of successful analysis of the performance evaluation samples was provided to the USEPA by Tierra Solutions Inc. in a letter dated November 1, 2005 (see Attachment A).

As outlined in the Phase I RIWP, the analysis of blanks, MS samples, and laboratory control samples provide laboratory results that may be compared to their associated known values to monitor potential bias. Blanks were used to assess the ability of the analysis to accurately quantify known zero values. MS and surrogate spike evaluations were used to assess bias by monitoring the actual recovery of a known quantity of a chemical, added to the native sample, versus the expected recovery. Likewise, actual versus expected recoveries of known laboratory control standards and performance evaluation samples (PCDDs/PCDFs only), were evaluated for potential bias.

Acceptance criteria for each of the quality control evaluations described above are provided in Section 6.6 of the Phase I RIWP. Conformance to field and laboratory QC sample frequency requirements, as well as acceptability of QC results for accuracy, were evaluated and considered during data validation.

1.3 Representativeness

Representativeness is the degree to which a data set accurately represents the characteristics of a population, parameter conditions at a sample point, or an environmental condition. Data are representative when all sampling and analyses are performed in compliance with appropriate procedures. Performing sample analyses within the specified holding times and adhering to sample handling and storage requirements are also critical elements in obtaining representative sample data. These elements were evaluated and considered during data validation and qualification. Acceptance criteria for sample handling, storage and holding times are provided in Tables 6-6 and 6-7 of the Phase I RIWP.

1.4 Completeness

There are two measures of completeness defined for the Phase I RIWP program: field completeness and analytical completeness. Field completeness is defined as the ratio of the number of samples received in acceptable condition by the laboratories to the number of samples planned to be collected as specified in the Phase I RIWP. Analytical completeness is defined as the ratio of total valid analytical data results (including estimated values) to the total number of analytical results requested on samples submitted for analysis. The formulas used to compute field and analytical completeness are presented below.

$$\% \text{ Field Completeness} = \left(\frac{Number\ of\ Samples\ Received\ by\ Laboratories}{Total\ Number\ of\ Samples\ Planned\ to\ be\ Collected}\right) \times 100$$

$$\% \text{ Analytical Completeness} = \left(\frac{Total\ Valid\ Analytical\ Data}{Analytical\ Data\ Obtained}\right) \times 100$$

The targeted field and analytical completeness goals were 90% for the Phase I RIWP program; these goals were met, or exceeded, as summarized below.

Phase I RIWP Overall	Completeness Goal Established in Phase I RIWP	Completeness Achieved
Field Completeness	90%	90.8%
Analytical Completeness	90%	99.5%

Phase I RIWP Analytical Completeness by Analysis and Sample Type	Completeness Achieved
Sediment	
Volatile Organic Compounds	98.4%
Semivolatile Organic Compounds	99.9%
Total Extractable Petroleum Hydrocarbons	100%
Pesticides	99.7%
Aroclor PCBs	100%
Congener PCBs	99.5%
Herbicides	100%
Polychlorinated dibenzo-*p*-dioxins and polychlorinated dibenzofurans	100%
Metals	98.3%
Cyanide	96.7%
Total Organic Carbon	100%
Radiochemical	100%
Organotins	98.5%
Field Blanks/Trip Blanks	
Volatile Organic Compounds	98.3%
Semivolatile Organic Compounds	100%
Total Extractable Petroleum Hydrocarbons	100%
Pesticides	100%
Aroclor PCBs	100%
Congener PCBs	100%
Herbicides	100%
Polychlorinated dibenzo-*p*-dioxins and polychlorinated dibenzofurans	100%
Metals	98.1%
Cyanide	100%
Total Organic Carbon	100%
Organotins	100%

1.5 Comparability

Comparability expresses the confidence with which one set of data can be compared to another to measure the same property. Data can be compared to the degree that their accuracy, precision, and representativeness are known and documented. Data are comparable if QC measures such as collection techniques, measurement procedures, analytical methods, and reporting units are equivalent for the samples within a sample set. Data subject to established QA/QC measures are deemed more reliable and, therefore, more comparable, than data generated without such measures.

Consistent application of prescribed procedures was monitored throughout the Phase I RIWP program. Field and laboratory audits were used to assess conformance with the Phase I RIWP during sampling and analytical activities. Per Section 7.2.3 of the Phase I RIWP, field and laboratory audit reports are located in the Newark Bay Central Project File. These audit reports can be provided by Tierra for review at the USEPA's request. Likewise, specific data validation protocols were consistently applied to all chemical and radiochemical data generated under this program to understand and document accuracy, precision and representativeness, thereby establishing comparability as defined above.

During data validation activities, analytical data were evaluated using a defined set of guidelines and acceptance criteria. In addition, data validation qualifiers were consistently applied to the analytical data generated during the Phase I RIWP program. When consistently applied, the data validation process serves to allow data comparability to be established between the Phase I RIWP data and other data sets.

2. Phase I RIWP Data Validation and Qualification

2.1 Data Validation Status

Phase I RIWP analytical results were provided by the laboratories both electronically and in hard copy format. Upon receipt from the laboratory, results for specific analytical groups described below were validated by Environmental Data Services, Ltd. (EDS) as per the Section 8 of the Phase I RIWP using the following procedures:

Aroclor PCB and pesticide data	USEPA Region 2 SOP No. HW-23, Revision 1.0, May 2002
Semivolatile organics data	USEPA Region 2 SOP No. HW-22, Revision 2, June 2001
Herbicide data	USEPA Region 2 SOP No. HW-17, Revision 1.3, November 1994
Metals and cyanide data	USEPA Region 2 SOP No. HW-2, Revision 11, January 1992
Dioxin and furan Isomer data	USEPA Region 2 SOP No. HW-25, Revision 2, September 1999
Volatile organics data	USEPA Region 2 SOP No. HW-24, Revision 1, June 1999

USEPA Region 2 did not have established validation standard operating procedures (SOPs) for radiochemical, congener PCB, TEPH, organotin, or TOC analyses at the time the Phase I RIWP was written and approved. Therefore, validation and qualification for these data types were specified in data validation SOPs prepared for this project. All validation SOPs (USEPA Region 2 and project-specific) that were used during the implementation of the Phase I RIWP are provided in Appendix D of the Phase I RIWP.

The Phase I RIWP sediment chemical and radiochemical data (as described above) underwent a full data validation process. This independent data validation process was described, in detail, in Section 8 of the Phase I RIWP. Based on the outcome of the data validation process, data validation qualifiers were added to the laboratory-reported sample results, as appropriate. The data validation qualifiers provide the data user with additional information about the usability of a given data point, the degree of certainty in the data, and indicate bias in a data point when assignment of bias is possible. The list of data validation qualifiers used to qualify data collected during the Phase I RIWP implementation is provided in Table 1 of this document.

2.2 Data Quality Issues and Data Qualification/Usability

Two types of data quality issues are discussed in this section, systematic data quality issues (Section 2.2.1) and random data quality issues (Section 2.2.2). Systematic data quality issues are those that are

identified as having a consistent impact on the quality of numerous results reported (i.e., data quality of many samples and/or constituent classes are affected by a single data quality issue), due to a common circumstance or procedural application. Random data quality issues are those that impact the quality of results on a limited basis (i.e., data quality for a specific sample(s) and/or analyte(s) are affected by the data quality issue).

2.2.1 Systematic Data Quality Issues and Data Qualification

One systematic data quality issue was identified during the Phase I RIWP data validation task. This systematic data quality issue is summarized in the text below. Complete details regarding this data quality issue and corresponding corrective actions have been documented in the Phase I RIWP Corrective Action Form 004, which has been provided as an attachment to this report (see Attachment B). Systematic data quality issues and the resulting data qualification are also discussed along with random data quality issues in Section 2.3 of this report.

Elevated sample quantitation limits (SQLs) and associated re-extraction/re-analysis outside of holding time was the one systematic data quality issue identified during validation of the Phase I RIWP sediment semivolatile (SVOC), pesticide, Aroclor PCB, and herbicide analyses. Many samples were initially extracted and analyzed using less than method-required sample aliquots and/or were diluted prior to analysis. These anomalies resulted in many of those same initial sample results being reported as not detected at elevated sample quantitation limits (SQLs). Although subsequent corrective actions, which included re-extraction and re-analysis, resulted in an improvement in the affected data set, a significant number of SVOC, pesticide, Aroclor PCB and herbicide results remained as not detected at an elevated SQL (see further discussion below). Sixty-three percent (63%) or 18,622 SVOC, pesticide, Aroclor PCB and herbicide SQLs were higher than those listed as analyte-specific DQOs in Section 5.2.1 of the Phase I RIWP. The majority of the affected sediment SVOC, pesticide, and Aroclor PCB analyses were repeated by the laboratory. The samples were re-extracted using method-specified sample aliquots, and, in some cases, additional extract clean-up techniques were used that were not applied during the initial analyses. Gel permeation chromatography (GPC), and, in the case of Aroclor PCBs, acid and copper extract clean-up techniques were employed. These extracts were then analyzed in nearly all cases without further dilution. The re-analysis results provided a twenty-five percent increase in the number of positive results identified as compared to the initial analyses, especially for results at lower concentration levels.

The re-extracted and re-analyzed positive sample values were evaluated using the previously described Phase I RIWP data validation protocols. Those positive sample values exhibiting acceptable data quality (with the exception of analyses not being done within the allowable sample holding time) were included in the final Phase I RIWP database. However, results of the re-analyses were qualified as “J” (estimated) reflecting extraction and analysis beyond the allowable holding time (described in the following subsections). A total of 3,621 or 12% of sediment SVOC, pesticide, and Aroclor PCB results required qualification as “J” (estimated) due to corrective action (re-extraction/re-analyses) outside the allowable holding time.

2.2.2 Random Data Quality Issues and Data Qualification

Many random data quality issues were identified during the Phase I RIWP data validation task. Random data quality issues and the resulting data qualification are discussed in Section 2.3 of this report.

2.3 Data Qualification/Usability Summarized by Constituent Class

The following discussion summarizes the data validation findings and associated qualifications related to systematic and random data quality issues for each constituent class. These validation findings have been separated into two distinct categories, major data quality issues and minor data quality issues.

Major data quality issues are those that result in the qualification of the analytical value reported as "R," or rejected. Rejection of a data point indicates that the analysis is invalid and provides no information as to whether the analyte is present or not. Data usability is distinguished based on the presence or absence of the "R" validation qualifier. Rejected data are not usable, while data that have not been rejected are usable.

Minor data quality issues include all other QA/QC issues identified during the data validation process that require sample results to be qualified, indicating a level or type of uncertainty associated with the reported result. Qualifiers applied to sample results were determined based on the data validation protocols specified in Section 8 of the Phase I RIWP.

Volatile Organic Compounds (VOCs)

The Phase I RIWP sediment VOC data set is comprised of 301 samples with 9,933 associated results.

Two major data quality issues were identified during validation of the Phase I RIWP sediment VOC analytical data. One sample exhibited a non-compliant internal standard area response of less than 25% of the daily standard, and instances were observed where initial and/or continuing calibrations were found to have relative response factors for various target analyte VOCs that were extremely low (less than 0.05). The affected target analyte results were qualified as "R" (rejected/unusable).

Major Data Quality Issues

Volatiles	Data Quality Parameter Affected	Number of Samples Affected	Number of Results Affected	% of VOC Results Affected
Results qualified as unusable due to non-compliant internal standard area responses	Accuracy	1	1	0.01
Results qualified as unusable due to extremely low relative response factors observed during associated calibrations	Accuracy	153	153	1.5

Eight minor data quality issues were identified in the Phase I RIWP sediment VOC data, they are described in the table below. Sample results affected by the minor quality issues outlined below were qualified as "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate.

Minor Data Quality Issues				
Volatiles	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of VOC Results Affected**
Non-compliant initial calibration (RRF)	Accuracy	288	353	3.6
Non-compliant continuing calibration % difference	Accuracy	133	347	3.5
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	14	104	1.0
Non-compliant laboratory control sample recovery	Accuracy	72	151	1.5
Method blank contamination	Accuracy	85	97	0.98
Non-compliant surrogate standard recovery	Accuracy	12	396	4.0
Non-compliant internal standard area response	Accuracy	37	37	0.37
Exceeded holding times	Representativeness	1	33	0.33

Semivolatile Organic Compounds (SVOCs)

The Phase I RIWP sediment SVOC data set is comprised of 301 samples with 19,264 associated results.

One major data quality issue was identified during validation of the Phase I RIWP sediment SVOC analytical data. Six samples exhibited extremely low (less than 10%) recovery for hexachlorocyclopentadiene during the matrix spike evaluation. The affected sediment SVOC results were qualified as "R" (rejected/unusable).

Major Data Quality Issues				
Semivolatiles	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of SVOC Results Affected**
Results qualified as unusable due to extremely low matrix spike recovery	Accuracy	6	6	0.03

Five minor data quality issues were identified in the Phase I RIWP sediment SVOC data; they are described in the table below. Sample results affected by the minor quality issues outlined below were qualified as "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate.

Minor Data Quality Issues				
Semivolatiles	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of SVOC Results Affected**
Non-compliant continuing calibration % difference	Accuracy	269	712	3.7
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	41	225	1.2
Non-compliant laboratory control sample recovery	Accuracy	399	1,253	6.5
Non-compliant field duplicate precision	Precision	2	18	0.09
Re-analysis of samples beyond holding times	Representativeness	211	3,361	17

Total Extractable Petroleum Hydrocarbons (TEPH)

The Phase I RIWP sediment TEPH data set is comprised of 299 samples with 299 associated results.

No major data quality issues were identified during validation of the Phase I RIWP sediment TEPH analyses.

Three minor data quality issues were identified and are listed in the table below. Sample results associated with these minor data quality issues were qualified as "J" (estimated) with bias indicated where appropriate, and/or "U" (not detected) as appropriate.

Minor Data Quality Issues				
TEPH	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of TEPH Results Affected**
Non-compliant surrogate recovery	Accuracy	27	27	9.0
Non-compliant matrix spike recovery	Accuracy	1	1	0.33
Method blank contamination	Accuracy	2	2	0.67

Pesticides

The Phase I RIWP sediment Pesticide data set is comprised of 301 samples with 6,321 associated results.

Two major data quality issues were identified during validation of the Phase I RIWP pesticides analyses. Matrix spike and matrix spike duplicate recoveries during one set of evaluations were extremely low (less than 10%), for 4,4'-DDT. Column degradation standards were observed as unacceptable during 3 analysis sequences affecting 16 samples (17 results). The affected target analyte results were flagged "R" (rejected/unusable).

Major Data Quality Issues				
Pesticides	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Pesticides Results Affected**
Extremely low matrix spike/matrix spike duplicate recovery observed	Accuracy	1	1	0.01
Analytical column degradation	Representativeness	16	17	0.27

Eight minor data quality issues were identified and are listed in the table below. Sample results affected by the minor data quality issues as outlined below were qualified "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate with the following exceptions. In the case of minor data quality issue *Difference between results obtained from two analytical columns in excess of validation criteria*, the affected sample results were qualified as either "J" (estimated), or "NJ" (tentatively identified), for percent differences greater than 25% but less than 90% between results obtained from the two analytical columns; or "U" (not detected) at the sample quantitation limit (SQL) for percent differences greater than 90% between results obtained from the two analytical columns when both values are less than the SQL.

Minor Data Quality Issues				
Pesticides	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Pesticides Results Affected**
Re-analysis of samples beyond allowable holding time	Representativeness	24	61	0.96
Non-compliant continuing calibrations	Accuracy	221	495	7.8
Method blank contamination	Accuracy	1	1	0.01
Non-compliant laboratory control sample recovery	Accuracy	16	16	0.25
Difference between results obtained from two analytical columns in excess of validation criteria	Precision	NC	332	5.2
Non-compliant surrogate recoveries	Accuracy	5	34	0.54
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	22	45	0.71
Analytical column degradation – minor impact	Representativeness	15	16	0.25

NC =Not calculated

Aroclor PCBs

The Phase I RIWP sediment Aroclor PCB data set is comprised of 301 samples with 2,709 associated results.

No major data quality issues were identified during validation of the Phase I RIWP sediment Aroclor PCB analyses.

Four minor data quality issues were identified and are identified in the table below. Sample results affected by the minor data quality issues as outlined below were qualified "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate with the following exceptions. In the case of minor data quality issue *Difference between results obtained from two analytical columns in excess of validation criteria*, the affected sample results were qualified as either "J" (estimated), or "NJ" (tentatively identified), for percent differences greater than 25% but less than 90% between results obtained from the two analytical columns; or "U" (not detected) at the sample quantitation limit (SQL) for percent differences greater than 90% between results obtained from the two analytical columns when both values are less than the SQL.

Minor Data Quality Issues				
Aroclor PCBs	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Aroclor PCB Results Affected**
Re-analysis of samples beyond allowable holding time	Representativeness	141	199	7.3
Non-compliant continuing calibrations	Accuracy	189	298	11
Non-compliant surrogate recoveries	Accuracy	54	486	18
Difference between results obtained from two analytical columns in excess of validation criteria	Precision	NC	125	4.6

NC = Not calculated

Congener PCBs

The Phase I RIWP sediment Congener PCB data set is comprised of 301 samples with 50,568 associated results.

Two major data quality issues were identified during validation of the Phase I RIWP sediment Congener PCB analyses. Nine samples exhibited extremely low labeled-recovery standard area response (less than 25% of the daily standard). The associated non-detected target analyte results were qualified as "R" (rejected/unusable). A second major data quality issue was related to failed identification criteria for 50 positive sample results reported. The affected target analyte results were qualified as "R" (rejected/unusable).

Major Data Quality Issues				
Congener PCBs	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Congener PCB Results Affected**
Non-compliant recovery standard area responses	Accuracy	9	182	0.36
Failed identification criteria	Representativeness	33	50	0.10

Six minor data quality issues were identified and are identified in the table below. Sample results associated with these minor data quality issues were qualified as "J" (estimated) or "EMPC" (estimated maximum possible concentration), as appropriate.

Minor Data Quality Issues				
Congener PCBs	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Congener PCB Results Affected**
Method blank contamination	Representativeness	74	272	0.54
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	1	3	0.01
Non-compliant field duplicate precision	Precision	15	36	0.07
Non-compliant labeled recovery standard area response	Accuracy	91	12,187	24
Interferences affecting accurate quantitation of PCB-81	Representativeness	171	171	0.34
Non-compliant internal standard recoveries	Accuracy	1	119	0.23

Herbicides

The Phase I RIWP sediment Herbicide data set is comprised of 299 samples with 1,196 associated results.

No major data quality issues were identified during validation of the Phase I RIWP sediment herbicide analyses.

Four minor data quality issues were identified and are listed in the table below. Sample results affected by the minor data quality issues as outlined below were qualified "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate with the following exceptions. In the case of minor data quality issue *Difference between results obtained from two analytical columns in excess of validation criteria*, the affected sample results were qualified as either "J" (estimated), or "NJ" (tentatively identified), for percent differences greater than 25% but less than 90% between results obtained from the two analytical columns; or "U" (not detected) at the sample quantitation limit (SQL) for percent differences greater than 90% between results obtained from the two analytical columns when both values are less than the SQL.

Minor Data Quality Issues				
Herbicides	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Herbicides Results Affected**
Non-compliant initial or continuing calibrations	Accuracy	191	348	29
Non-compliant laboratory control sample recovery	Accuracy	21	21	1.7
Non-compliant surrogate recoveries	Accuracy	14	17	1.4
Difference between results obtained from two analytical columns in excess of validation criteria	Precision	NC	148	12

NC = Not calculated

Polychlorinated dibenzo-*p*-dioxins and polychlorinated dibenzofurans (PCDDs/PCDFs)

The Phase I RIWP sediment PCDD/PCDF data set is comprised of 301 samples with 5,117 associated results.

No major data quality issues were identified during validation of the Phase I RIWP sediment PCDDs/PCDFs analyses.

Six minor data quality issues were identified and are listed in the table below. The sample results affected by these minor data quality issues were qualified as "J" (estimated) with bias indicated where appropriate or "EMPC" (estimated maximum possible concentration), as appropriate.

Minor Data Quality Issues

PCDDs/PCDFs	Data Quality Parameter Affected	Number of Samples Affected	Number of Results Affected	% of PCDDs/PCDFs Results Affected
Non-compliant internal standard recovery	Accuracy	7	87	1.7
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	3	3	0.06
Non-compliant field duplicate precision	Precision	4	10	0.19
Method blank contamination	Accuracy	28	49	0.96
Field blank contamination	Accuracy	8	11	0.21
Presence of a corresponding chlorinated diphenyl ether peak when a positive PCDF was identified	Representativeness	184	188	3.7

Metals

The Phase I RIWP sediment Metals data set is comprised of 300 samples with 7,200 associated results.

Three major data quality issues were identified during validation of the Phase I RIWP sediment metals data that resulted in "R" qualification (rejected/unusable) of specific metals data as follows. Thirty-three samples were associated with an extremely poor contract-required detection limit (CRDL) standard recovery (below 50% or greater than 150%). Thiry-nine samples were associated with an extremely poor matrix spike recovery (below 10% or above 200%), and thirty-two samples were associated with a method blank exhibiting contamination above the SQL.

Major Data Quality Issues

Metals	Data Quality Parameter Affected	Number of Samples Affected	Number of Results Affected	% of Metals Results Affected
Non-compliant CRDL standard recovery	Accuracy	33	33	0.46
Extremely poor matrix spike recovery	Accuracy	39	59	0.82
Method blank contamination	Accuracy	32	32	0.44

Five minor data quality issues were identified and are listed in the table below. Sample results associated with these minor data quality issues were qualified as "J" (estimated) with bias indicated where appropriate, and/or "U" (not detected) as appropriate.

Minor Data Quality Issues				
Metals	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Metals Results Affected**
CRDL standard recovery outside validation acceptance criteria	Accuracy	119	182	2.5
Serial dilution determination result outside validation acceptance range	Representativeness	215	455	6.3
Non-compliant matrix spike recovery	Accuracy	300	588	8.2
Poor laboratory duplicate precision	Precision	37	43	0.60
Calibration/Instrument blank contamination	Accuracy	16	16	0.22

Cyanide

The Phase I RIWP sediment Cyanide data set is comprised of 299 samples with 299 associated results.

One major data quality issue was identified during validation of the Phase I RIWP cyanide analyses. Matrix spike and matrix spike duplicate (MS/MSD) recoveries during ten MS/MSD evaluations were extremely low (less than 10%), resulting in the affected target analyte results being flagged "R" (rejected/unusable) in associated samples.

Major Data Quality Issues				
Cyanide	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Cyanide Results Affected**
Extremely poor matrix spike recovery	Accuracy	10	10	3.3

The one minor data quality issue identified (listed in the table below) was also related to non-compliant matrix spike recovery; the affected results were qualified as either "JL" (estimated low bias) or "UJL" (estimated non-detect, potential low bias).

Minor Data Quality Issues				
Cyanide	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Cyanide Results Affected**
Non-compliant matrix spike recovery	Accuracy	123	123	41

Total Organic Carbon (TOC)

The Phase I RIWP sediment TOC data set is comprised of 299 samples with 299 associated results.

No major or minor data quality issues were identified during validation of the Phase I RIWP TOC analyses.

Radiochemical

The Phase I RIWP sediment Radiochemical data set is comprised of 547 samples with 984 associated results.

No major data quality issues were identified during validation of the Phase I RIWP radiochemical analyses.

The one minor data quality issue identified (listed in the table below) was related to non-compliant Pb-210 laboratory control sample recovery; the affected results were qualified as "JH" (estimated high bias).

Minor Data Quality Issues

Pb-210	Data Quality Parameter Affected	Number of Samples Affected	Number of Results Affected	% of Radiochemical Results Affected
Non-compliant laboratory control sample recovery	Accuracy	20	20	2.0

Organotins

The Phase I RIWP sediment Organotin data set is comprised of 299 samples with 1,196 associated results.

One major data quality issue was identified during validation of the Phase I RIWP organotin analyses. Matrix spike and matrix spike duplicate recoveries associated with 17 sample delivery groups were extremely low (less than 10%), for monobutyltin. Affected target analyte results were flagged "R" (rejected/unusable).

Major Data Quality Issues

Organotins	Data Quality Parameter Affected	Number of Samples Affected	Number of Results Affected	% of Organotin Results Affected
Extremely poor matrix spike recovery	Accuracy	18	18	1.5

Three minor data quality issues were identified and are listed in the table below. Sample results affected by the minor data quality issues, as outlined below, were qualified "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate with the following exceptions. In the case of minor data quality issue *Difference between results obtained from two analytical columns in excess of validation criteria*, the affected sample results were qualified as either "J" (estimated), or "NJ" (tentatively identified), for percent differences greater than 25% but less than 90% between results obtained from the two analytical columns; or "U" (not detected) at the sample quantitation limit (SQL) for percent differences greater than 90% between results obtained from the two analytical columns when both values are less than the SQL.

Minor Data Quality Issues				
Organotins	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Organotin Results Affected**
Non-compliant laboratory control sample recovery	Accuracy	2	6	0.50
Differences between results obtained from two analytical columns in excess of validation criteria	Precision	NC	50	4.2
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	6	6	0.50

NC = Not calculated

2.4 Miscellaneous Data Qualification

Moisture Content

Moisture content greater than 50% is not uncommon for sediment samples. Per the Phase I RIWP, an "M" flag was applied during data validation when a sample was found to contain between 50% and 90% moisture and no other data quality issues were identified that required data qualification. Fifty-two percent of the total chemical sediment sample results which were analyzed on a wet weight basis had observed moisture content values observed to be between 50 and 90%. Therefore the data validation qualifier most frequently applied to the Phase I RIWP sediment data set was the "M" flag.

3. References

Tierra. 2005. Newark Bay Study Area Remedial Investigation Work Plan [Rev.1]. September.

Table 1
Data Validation Qualifiers

Qualifier	Description
J	Estimated value (bias undetermined) – The analyte was positively identified; but the associated numerical value is the approximate concentration of the analyte in the sample.
JH	Estimated value (potential high bias) – The analyte was positively identified; but the associated numerical value is the approximate concentration, with a potential high bias, of the analyte in the sample.
JL	Estimated value (potential low bias) – The analyte was positively identified; but the associated numerical value is the approximate concentration, with a potential low bias, of the analyte in the sample.
UJ	Estimated non-detect - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
UJL	Estimated non-detect (potential low bias) – The analyte was not detected and the report sample quantitation limit is biased low.
UJH	Estimated non-detect (potential high bias) – The analyte was not detected and the reported sample quantitation limit is biased high.
M	The analytical result reported was obtained from a sediment sample found to contain between 50 and 90 percent moisture and had no other data qualifiers added during the data validating process.
NJ	The organic analysis indicates the presence of an analyte that has been “tentatively identified” and the associated numerical value represents its approximate concentration.
NJH	The organic analysis indicates the presence of an analyte that has been “tentatively identified” and the associated numerical value represents its approximate concentration with a potential high bias, of the analyte concentration.
EMPC	Estimated Maximum Possible Concentration (EMPC).
R	The sample results are rejected. Due to a significant QA/QC problem, the analysis is invalid and provides no information as to whether the analyte is present or not.
U	Non-detect -The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

ATTACHMENT A

TIERRA SOLUTIONS, INC.

Attention: Ms. Elizabeth Butler
Remedial Project Manager

Subject: Administrative Order on Consent, U.S.E.P.A. Index No. CERCLA-02-2004-2010 for Newark Bay Study Area – *Dioxin-specific Performance Evaluation Samples for RIWP Phase I*

Dear Ms. Butler:

Tierra Solutions, Inc. [funding and performing, on behalf of Occidental Chemical Corporation, the subject Administrative Order On Consent (Newark Bay AOC)] (Respondent) hereby submits three copies [2 paper, 1 electronic (to be submitted via electronic mail to butler.elizabeth@epamail.epa.gov)] of results to a Performance Evaluation (PE) study conducted during pre-mobilization activities for Newark Bay Study Area (NBSA) Remedial Investigation Work Plan (RIWP) Phase I Sediment Investigation (SI) activities.

Per section 6.7.2.6 of RIWP Revision 1, September 2005 dioxin-specific PE samples (i.e., Standard Reference Materials [SRMs]) representing a solid sample matrix were purchased from a commercial vendor. The PE samples contained various target dioxin/furan isomers at known and certified reference concentrations. The PE samples were submitted blind to Alta Analytical Laboratory, Inc. (Alta). One PE sample was certified to contain low level or no concentration of dioxin/furan isomers while the second contained known and certified concentrations of each dioxin/furan isomer.

The low level PE results (ED-NBRIWP-A) were compliant in all cases and fell within the certified acceptance ranges provided by the vendor. However, the contaminated PE results (ED-NBRIWP-B) reported by Alta were higher than the certified reference ranges in 9 of 17 cases. As a result, Environmental Data Services, LTD (EDS), RIWP Phase I Quality Assurance Contractor (QAC), worked closely with Alta to identify the cause of the non-compliant PE sample and to design and implement appropriate corrective action prior to initiation of Phase I field sampling. Corrective action was successfully implemented and confirmed by compliant analysis of a second contaminated PE sample (ED-NBRIWP-C) provided by an alternate vendor. Details of the ED-NBRIWP-B non-compliance and the resultant corrective action shall be submitted shortly under separate cover.

10th floor
Two Tower Center Blvd. East Brunswick, New Jersey 08816

Data assessment narratives for ED-NBRIWP-A and ED-NBRIWP-C are included as attachments.

Please feel free to contact me if you have any questions regarding this submittal.

Sincerely,

FOR

DIOXIN DATA ASSESSMENT NARRATIVE

SITE: Newark Bay Phase I

LABORATORY: Alta

SAMPLE DELIVERY GROUP: ED-NBRIWP-A

This sample delivery group consists of the following sample:

EDNBRIWPA

The sample described above was analyzed via USEPA method 1613B Protocol to determine the concentrations of PCDD/PCDF compounds in sediment, in this case a Performance Evaluation (PE) sample.

USEPA Region II's data validation checklist HW-25, REV2, September, 1999 was used to perform the dioxin data validation.

All data are valid and acceptable except those analytes, which have been qualified with a "J" (estimated), "N" (presumptive evidence of the presence of the material), "R" (unusable), or "JN" (presumptive evidence of the presence of a material at an estimated value). When specific circumstances exist, the validator may also be required to qualify positive sample values as estimated maximum possible concentration (EMPC). All data qualification related to this group of samples is detailed on the attached sheets.

Major Data Quality Issues

None.

Minor Data Quality Issues

Interferences – The 1,2,3,4,6,7,8-HpCDF value for the sample in the delivery group has been qualified as an EMPC, due to the presence of the corresponding diphenyl ether at a peak signal greater than 2.5 times that of background noise.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable due to significant QC problems, the data is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on any data tables even as a last resort.

Lastly, no analyte concentration, even if it passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Date: 10-14-05

Diane Waldschmidt
Environmental Scientist/Director

HOLDING TIME

All samples in this delivery group were prepared and analyzed within the holding time specified in the validation guideline.

CHROMATOGRAPHIC RESOLUTION

A performance check solution (Window Defining Mixture/Isomer Specificity Test Standard) was analyzed at the beginning and end of every 12-hour analysis period. Upon evaluation of the performance check solution data all QC criteria were met. Therefore, the data associated with these check standards were not qualified.

INITIAL CALIBRATION

Data was submitted representing six concentration level initial calibrations. All initial calibrations used during the analysis of the sample in this delivery group were contained in the data package.

The validator has evaluated the initial calibrations examining ion ratios, signal to noise ratios, retention time and percent relative standard deviation criteria for all PCDD/PCDF target analytes and their labeled analogs.

Upon examination of the initial calibration data, all of the criteria listed in method 1613B were met.

ROUTINE CALIBRATION

A routine calibration standard was evaluated at the beginning and end of each 12-hour analysis period.

The validator has evaluated the routine calibration standard data submitted examining ion ratios, retention time, signal to noise ratios, and percent difference criteria for all PCDD/PCDF target analytes and their labeled analogs.

Upon examination of the routine calibration data submitted, all of the criteria listed in method 1613B were met.

SAMPLE DATA

Qualitative Requirements

All positively reported results met method and validation qualitative acceptance criteria.

Quantitative Requirements

Sample and internal standard concentration calculations were verified and no errors were detected.

Interferences

Positive PcDF values reported for the sample in this delivery group were evaluated to determine the presence of the corresponding diphenyl ether at a peak signal greater than 2.5 times that of the background noise. Upon evaluation, the chromatogram for sample EDNBRIWPA exhibited an interference peak of a diphenyl ether (at greater than 2.5 times background) within the retention time range of 1,2,3,4,6,7,8-HpCDF. Per validation guidance, the positive result reported for 1,2,3,4,6,7,8-HpCDF in sample EDNBRIWPA has been qualified as an EMPC.

BLANKS

Rinsate Blanks

This sample delivery group contains only a pre-project PE sample. Therefore, no rinsate blank is required.

Method Blanks

Method blanks were prepared and analyzed in association with the sample in this delivery group at the specified frequency. Upon examination of method blank data, no analyte was positively identified at a concentration above the method defined minimum levels in any associated method blank.

FIELD DUPLICATE

This sample delivery group contains only a pre-project PE sample, therefore no field duplicate is required.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

This sample delivery group contains only a pre-project PE sample. Therefore, no matrix spike or matrix spike duplicate are required.

INTERNAL STANDARD

Internal standards ($^{13}C_{12}$–2,3,7,8-TCDD and $^{13}C_{12}$-1,2,3,7,8,9-HxCDD) are added to each sample and method blank extract prior to injection. The area counts for each of the recovery standards in each sample must fall within the range (+100% to –50%) of that observed during analysis of the mid- level calibration standard during the instrument initial calibration sequence.

Upon evaluation all internal standard responses were well within acceptable limits.

LABELED ANALOG STANDARDS

In all cases calculated percent recoveries of labeled analog standards were well within method and validation acceptance limits. No qualification of data was necessary.

OPR

Ongoing Precision and Recovery (OPR) standards were prepared and analyzed in association with the sample in this delivery group. All observed percent recoveries were well within method 1613B allowable limits during the OPR determination.

IPR

Initial Precision and Recovery (IPR) standards were prepared and analyzed successfully by the laboratory within the last calendar year. All observed average concentration and standard deviation values passed method defined acceptance criteria.

CLEAN-UP RECOVERY STANDARD

The clean-up recovery standard (^{37}Cl-2,3,7,8-TCDD) was successfully recovered from the sediment samples in the delivery group.

SECOND COLUMN CONFIRMATION

The positive TCDF results for all samples in the delivery group were confirmed via DB225 analyses. The validator has reported all positive TCDF results from data obtained on the DB225 analytical column.

DIOXIN DATA ASSESSMENT NARRATIVE

SITE: Newark Bay Phase I

LABORATORY: Alta

SAMPLE DELIVERY GROUP: ED-NBRIWP-C

This sample delivery group consists of the following sample:

EDNBRIWPC

The sample described above was analyzed via USEPA method 1613B Protocol to determine the concentrations of PCDD/PCDF compounds in sediment, in this case a Performance Evaluation (PE) sample.

USEPA Region II's data validation checklist HW-25, REV2, September, 1999 was used to perform the dioxin data validation.

All data are valid and acceptable except those analytes, which have been qualified with a "J" (estimated), "N" (presumptive evidence of the presence of the material), "R" (unusable), or "JN" (presumptive evidence of the presence of a material at an estimated value). When specific circumstances exist, the validator may also be required to qualify positive sample values as estimated maximum possible concentration (EMPC). All data qualification related to this group of samples is detailed on the attached sheets.

Major Data Quality Issues

None.

Minor Data Quality Issues

Interferences – The 1,2,3,6,7,8-HxCDF value for the sample in the delivery group has been qualified as an EMPC, due to the presence of the corresponding diphenyl ether at a peak signal greater than 2.5 times that of background noise.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable due to significant QC problems, the data is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on any data tables even as a last resort.

Lastly, no analyte concentration, even if it passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Date: 10-14-05

Diane Waldschmidt
Environmental Scientist/Director

HOLDING TIME

All samples in this delivery group were prepared and analyzed within the holding time specified in the validation guideline.

CHROMATOGRAPHIC RESOLUTION

A performance check solution (Window Defining Mixture/Isomer Specificity Test Standard) was analyzed at the beginning and end of every 12-hour analysis period. Upon evaluation of the performance check solution data all QC criteria were met. Therefore, the data associated with these check standards were not qualified.

INITIAL CALIBRATION

Data was submitted representing six concentration level initial calibrations. All initial calibrations used during the analysis of the sample in this delivery group were contained in the data package.

The validator has evaluated the initial calibrations examining ion ratios, signal to noise ratios, retention time and percent relative standard deviation criteria for all PCDD/PCDF target analytes and their labeled analogs.

Upon examination of the initial calibration data, all of the criteria listed in method 1613B were met.

ROUTINE CALIBRATION

A routine calibration standard was evaluated at the beginning and end of each 12-hour analysis period.

The validator has evaluated the routine calibration standard data submitted examining ion ratios, retention time, signal to noise ratios, and percent difference criteria for all PCDD/PCDF target analytes and their labeled analogs.

Upon examination of the routine calibration data submitted, all of the criteria listed in method 1613B were met.

SAMPLE DATA

Qualitative Requirements

All positively reported results met method and validation qualitative acceptance criteria.

Quantitative Requirements

Sample and internal standard concentration calculations were verified and no errors were detected.

Interferences

Positive PcDF values reported for the sample in this delivery group were evaluated to determine the presence of the corresponding diphenyl ether at a peak signal greater than 2.5 times that of the background noise. Upon evaluation, the chromatogram for sample EDNBRIWPC exhibited an interference peak of a diphenyl ether (at greater than 2.5 times background) within the retention time range of 1,2,3,6,7,8-HxCDF. Per validation guidance, the positive result reported for 1,2,3,6,7,8-HxCDF in sample EDNBRIWPC has been qualified as an EMPC.

BLANKS

Rinsate Blanks

This sample delivery group contains only a pre-project PE sample. Therefore, no rinsate blank is required.

Method Blanks

Method blanks were prepared and analyzed in association with the sample in this delivery group at the specified frequency. Upon examination of method blank data, no analyte was positively identified at a concentration above the method defined minimum levels in any associated method blank.

FIELD DUPLICATE

This sample delivery group contains only a pre-project PE sample, therefore no field duplicate is required.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

This sample delivery group contains only a pre-project PE sample. Therefore, no matrix spike or matrix spike duplicate are required.

INTERNAL STANDARD

Internal standards ($^{13}C_{12}$–2,3,7,8-TCDD and $^{13}C_{12}$-1,2,3,7,8,9-HxCDD) are added to each sample and method blank extract prior to injection. The area counts for each of the recovery standards in each sample must fall within the range (+100% to –50%) of that observed during analysis of the mid- level calibration standard during the instrument initial calibration sequence.

Upon evaluation all internal standard responses were well within acceptable limits.

LABELED ANALOG STANDARDS

In all cases calculated percent recoveries of labeled analog standards were well within method and validation acceptance limits. No qualification of data was necessary.

OPR

Ongoing Precision and Recovery (OPR) standards were prepared and analyzed in association with the sample in this delivery group. All observed percent recoveries were well within method 1613B allowable limits during the OPR determination.

IPR

Initial Precision and Recovery (IPR) standards were prepared and analyzed successfully by the laboratory within the last calendar year. All observed average concentration and standard deviation values passed method defined acceptance criteria.

CLEAN-UP RECOVERY STANDARD

The clean-up recovery standard (^{37}Cl-2,3,7,8-TCDD) was successfully recovered from the sediment samples in the delivery group.

SECOND COLUMN CONFIRMATION

The positive TCDF results for all samples in the delivery group were confirmed via DB225 analyses. The validator has reported all positive TCDF results from data obtained on the DB225 analytical column.

U.S. Environmental Protection Agency, Region II
Emergency and Remedial Response Division
290 Broadway, 19th Floor, Room W-20
New York, NY 10007-1866

Attention: Ms. Elizabeth Butler
Remedial Project Manager

Subject: Administrative Order on Consent, U.S.E.P.A. Index No. CERCLA-02-2004-2010 for Newark Bay Study Area – *Corrective Action Form 004*

Dear Ms. Butler:

Tierra Solutions, Inc. [funding and performing, on behalf of Occidental Chemical Corporation, the subject Administrative Order On Consent (Newark Bay AOC)] (Respondent) hereby submits three copies [2 paper, 1 electronic (to be submitted via electronic mail to butler.elizabeth@epamail.epa.gov)] of Corrective Action Form (CAF) 004 implemented during laboratory analytical and data validation activities associated with the Phase I Sediment Investigation (SI).

During Phase I SI data evaluation and data validation activities, non-conformances associated with the extraction and analysis of sediment samples for semivolatile organic compounds (SVOCs), pesticides, Aroclor PCBs, and herbicides were identified by the Quality Assurance Officer (QAO) and Quality Assurance Contractor (QAC) and reported to the Facility Coordinator (FC).

Upon approval from USEPA (personal communication, March 9, 2006), corrective actions, including re-extraction/re-analysis of a substantial number of sediment samples, were implemented.

The completed Corrective Action Form 004 with further description of the non-conformances and summary of the resolution is attached.

Please feel free to contact me if you have any questions regarding this submittal.

Sincerely,

Paul J. Bluestein
Alternate Facility Coordinator
On behalf of Occidental Chemical Corporation
(as successor to Diamond Shamrock Chemicals Company)

10th floor

Field/Laboratory Corrective Action Form

CORRECTIVE ACTION FORM

Project Name: Newark Bay Phase I RIWP CAF No.: 004

Project Number: N/A

Date Prepared: 09-07-06

Preparer: Diane Waldschmidt

Description of Non-Compliance	
Date(s) of Event(s): 11/05 – 4/06	Affected Plan/Section: Phase I RIWP Sections 5.2.1.2, 6.6.1, and 7.3.2

Per Section 6.6.1 of the Newark Bay Study Area (NBSA) Phase I Remedial Investigation Work Plan (RIWP), Rev. 1, Vol. 2a of 3, September 2005 (Phase I RIWP), Analytical Methods, sediment samples were to be extracted for semivolatile organic compounds (SVOC), pesticides, and Aroclor PCBs analyses using USEPA SW-846 3550B and for herbicide analyses using USEPA SW-846 8151A. Both procedures (3550B and 8151A) specify 30 grams of sample mass to be used in the extraction process.

Lancaster Laboratories, Inc. (Lancaster) performed the analyses described above. In some cases, Lancaster performed the procedures using sample sizes that were less than the 30 grams specified in these procedures.

The laboratory extracted a smaller amount of sediment than specified in the procedures, and in some cases diluted sample extracts prior to analysis in an effort to overcome matrix interferences/difficulties. However, by using a smaller sample size than specified in the analytical methodologies and/or analyzing a diluted sample extract, the sample quantitation limits (SQLs) were compromised. The laboratory failed to notify project team members of the observed sample matrix difficulties or its proposed corrective action of extracting smaller sample aliquots. Such notification is specified in Section 7.3.2 of the Phase I RIWP, Laboratory Corrective Actions. Instead the laboratory implemented these corrective actions and analyzed reduced sample aliquots and/or diluted sample extracts.

The non-conformances described above were identified by the Quality Assurance Officer (QAO) and Quality Assurance Contractor (QAC) and reported to the Facility Coordinator (FC) during preliminary data evaluation and data validation activities.

Lancaster management and staff were asked to review the situation and explain the method modifications employed. Upon review, Lancaster indicated that when processing sediment samples collected during the Phase I Sediment Investigation (SI), problems were encountered related to sample matrix, namely high percent moisture and high levels of petroleum-type components, resulting in samples having a "tarry" appearance. For these reasons, reduced sample sizes were used in the extraction of SVOCs, pesticides, Aroclor PCBs, and herbicides.

Corrective Action

The QAO and QAC, in conjunction with Lancaster management, discussed and reviewed the details presented by Lancaster regarding sediment sample matrix issues. After careful review, it was agreed that no alternate process was available for herbicides that would potentially improve analytical performance given the matrix difficulties encountered. Therefore, no corrective actions were recommended or carried out for the herbicide analytical fraction.

The following corrective actions were implemented after approval from USEPA Region 2, (personal communication, March 9, 2006) for the SVOC, pesticide, and Aroclor PCB fractions.

Those sediments extracted using a less than 30 gram aliquot and/or those analyzed based on a diluted extract were evaluated carefully examining percent moisture and total petroleum hydrocarbon results reported. Sediment samples were specified for re-extraction/re-analysis when they were found to contain less than 10,000 parts per million (ppm) total extractable petroleum hydrocarbons (TEPH) and less than 90% moisture. Aroclor PCB constituents were further evaluated to determine if samples were significantly positive for any target Aroclor PCB during the initial analysis making re-analysis of a more concentrated sample ineffective. Sediment samples identified for re-extraction/re-analysis as described above were re-extracted/re-analyzed using a 30 gram sample size as specified in Method 3050B.

Initially 301 sediment samples were analyzed for SVOCs, pesticides and Aroclor PCBs; of these the corrective actions described above were applied to 214 samples analyzed for SVOCs, 59 samples analyzed for pesticides and 147 samples analyzed for Aroclor PCBs. Samples that were re-extracted and re-analyzed after implementation of specified corrective actions are listed in the attached table (Attachment 1).

Extract clean-up processes were evaluated and recommended as additional/alternative corrective actions for the SVOC, pesticide, and Aroclor PCB analytical fractions. Gel Permeation Chromatography (GPC) SW846-3640 was employed as necessary to the re-extracted samples in advance of re-analysis. Use of this clean-up procedure was successful in removing large hydrocarbon petroleum type interferences, and therefore it allowed the laboratory to extract maximum sample mass and achieve method-specified final volumes. This in turn resulted in reporting limits consistent with those specified in Section 5.2.1.2 of the Phase I RIWP. These re-extracted and re-analyzed samples were processed and reported per Phase I RIWP requirements. The results and associated quality control measures were evaluated according to the data validation procedures outlined in Section 8.1.2 of the Phase I RIWP.

The corrective action measures were applied more than 100 days past sample collection. Therefore, per validation guidance, non-detected results obtained from the re-extracted/re-analyzed samples could not be used and were qualified as rejected ("R" flagged). In these instances the data from the original extractions/analyses were incorporated into the final Phase I RIWP analytical database.

Positive results obtained from the re-extracted/re-analyzed samples were evaluated via the data validation standard operating procedures specified in section 8.1.2 of the Phase I RIWP. The validated positive results for target analytes that were not previously identified (952 SVOCs, 58 pesticides, and 37 Aroclor PCBs) have been included in the final Phase I RIWP analytical database and have been qualified as estimated ("J" flagged) due to holding time exceedence.

Attachment A Performance Evaluation Samples for Phase II RIWP

This report provides a summary of the documentation and evaluation of data quality and usability for sediment chemistry data collected during the implementation of the Newark Bay Study Area Phase II Remedial Investigation Work Plan, Revision 2, Amendment 1 (Phase II RIWP; Tierra 2007).

1. Data Quality Parameters Overview

To determine whether the analytical data obtained were consistent with the objectives for the Phase II RIWP program five data quality parameters were evaluated, including specific data quality criteria assessed during analytical data validation. In the event that the data validation process identified an instance where any of the data quality parameters did not meet the objectives established in the Phase II RIWP, the affected sample results were evaluated in accordance with the data validation protocols specified in Section 13.2 of the Phase II RIWP and qualified accordingly. A detailed narrative describing each data qualifier applied to specific results can be found within the data validation reports prepared for each laboratory data package. Per Section 13.2 of the Phase II RIWP, laboratory data packages, completed assessment checklists, and data validation reports are located in the Newark Bay Project File. These data validation records can be provided by Tierra Solutions Inc. (Tierra) for review, at the United States Environmental Protection Agency's (USEPA) request.

The five data quality parameters assessed included the following:

- precision;
- accuracy;
- representativeness;
- completeness; and
- comparability.

Each of these data quality parameters, as it relates to the Phase II RIWP program, is discussed below.

1.1 Precision

Precision is the measure of variability between individual sample measurements of the same property under similar conditions. During the Phase II RIWP program, precision was evaluated through the analysis of replicate samples. Two types of replicate samples, field and laboratory duplicates, were analyzed at regular, specified intervals throughout the Phase II RIWP program.

Field duplicates consisted of select samples that were collected in the field at the frequency specified in the Phase II RIWP. These samples were homogenized (except for those to be analyzed for VOCs), split into two distinct samples, and were then submitted “blind” to the analytical laboratory (ies) for analysis (i.e., the sample identification did not reveal the sample with which the duplicate was associated). Relative percent differences (RPDs) between the field sample and the field duplicate results provide an estimate of the overall sampling and analytical precision.

Laboratory duplicates are two portions of a single homogeneous sample that are analyzed for the same parameter in order to determine the precision of the analytical system. Two types of laboratory duplicates

were performed. Laboratory duplicates without known analyte spikes added were analyzed to monitor laboratory precision for metals and cyanide analyses, while matrix spike and matrix spike duplicate evaluations were performed to monitor laboratory precision for the remaining analysis types. Laboratory duplicates were analyzed at the frequency specified in the Phase II RIWP. The RPD between results obtained for a given laboratory duplicate pair provides an estimate of analytical precision.

The precision assessment for both field and laboratory duplicate analyses is expressed as the RPD:

$$RPD = \left\{ \frac{(S - D)}{\frac{(S + D)}{2}} \right\} \times 100$$

where: S = original sample concentration
D = duplicate sample concentration

Acceptance criteria for field and laboratory duplicates are provided in Tables 9-1 and 9-2 of the Phase II RIWP. Conformance to field and laboratory duplicate frequency requirements, as well as acceptability of the resulting RPD values, were evaluated and considered during data validation.

Although field and laboratory duplicate analyses are used as indicators of relative precision of the sampling and analytical systems, the degree of homogeneity of the contaminants in the sample medium can also affect the reproducibility of a particular measurement. For example, pieces of decayed wood debris, chunks of asphalt, glass, free product, etc. can increase sample heterogeneity and therefore reduce the field/laboratory technician's ability to create homogeneous duplicate samples with which to measure precision. Since the sediment sample matrix characteristics can affect the way precision is measured, the sample matrix should be considered by the data user.

1.2 Accuracy

Accuracy is a measure of the bias in a system, and is defined as the degree of agreement between a measurement and an accepted reference, or true, value. Accuracy was monitored during the Phase II RIWP program through the evaluation of field blanks, laboratory blanks, matrix spike (MS) samples, and laboratory control samples (performed at regular, specified intervals). In addition, pre-mobilization performance evaluation samples were analyzed, for polychlorinated dibenzo-*p*-dioxins/polychlorinated dibenzofurans (PCDDs/PCDFs), semivolatile organics, pesticides, metals and congener PCBs only, prior to initiating field work. Documentation of successful analysis of the performance evaluation samples was provided to the USEPA by Tierra Solutions, Inc. in a letter dated October 9, 2007 (see Attachment A).

As outlined in the Phase II RIWP, field and laboratory blanks were used to monitor potential bias introduced by sampling procedures or laboratory contaminants. MS evaluations were used to assess bias by monitoring the actual recovery of a known quantity of a chemical, added to the native sample, versus the expected recovery. Likewise, actual versus expected recoveries of known laboratory control standards and performance evaluation samples (PCDDs/PCDFs, semivolatile organics, pesticides, metals and congener PCBs only), were evaluated for potential bias.

Acceptance criteria for each of the quality control evaluations described above are provided in Tables 9-1 and 9-2 of the Phase II RIWP. Conformance to field and laboratory quality control (QC) sample frequency requirements, as well as acceptability of QC results for accuracy, were evaluated and considered during data validation and qualification.

1.3 Representativeness

Representativeness is the degree to which a data set accurately represents the characteristics of a population, parameter conditions at a sample point, or an environmental condition. Data are representative when all sampling and analyses are performed in compliance with appropriate procedures. Performing sample analyses within the specified holding times and adhering to sample handling and storage requirements are also critical elements in obtaining representative sample data. These elements were evaluated and considered during data validation and qualification. Acceptance criteria for sample handling, storage and holding times are provided in Tables 6-7 and 6-10 of the Phase II RIWP.

1.4 Completeness

There are two measures of completeness defined for the Phase II RIWP program: field completeness and analytical completeness. Field completeness is defined as the overall number of planned samples compared with the number of samples received by the laboratory (ies) in acceptable condition for analysis. Analytical completeness is defined as the overall number of valid analytical results (following validation of the data packages, and including estimated values) compared with the total number of analytical results requested on samples received by the laboratory for analysis. The formulas used to compute field and analytical completeness are presented below.

$$\%\ \text{Field Completeness} = \left(\frac{Number\ of\ Samples\ Received\ by\ Laboratories}{Total\ Number\ of\ Samples\ Planned\ to\ be\ Collected}\right) \times 100$$

$$\%\ \text{Analytical Completeness} = \left(\frac{Total\ Valid\ Analytical\ Data}{Analytical\ Data\ Obtained}\right) \times 100$$

The targeted field and analytical completeness goals were 90% for the Phase II RIWP program; these goals were met or exceeded, as summarized below.

Phase II RIWP Overall	Completeness Goal Established in Phase II RIWP	Completeness Achieved
Field Completeness	90%	95.3%
Analytical Completeness	90%	99.0%

Phase II RIWP Analytical Completeness by Analysis and Sample Type	Completeness Achieved
Sediment	
Volatile Organic Compounds	99.6%
Semivolatile Organic Compounds	98.3%
Total Extractable Petroleum Hydrocarbons	100%
Pesticides	97.1%
Aroclor PCBs	99.9%
Congener PCBs	99.7%
Herbicides	74.9%
Polychlorinated dibenzo-*p*-dioxins and polychlorinated dibenzofurans	100%
Metals	99.3%
Cyanide	100%
2,4-Series Pesticides	97.5%
Total Organic Carbon	100%
Radiochemical	100%
Field Blanks/Trip Blanks	
Volatile Organic Compounds	100%
Semivolatile Organic Compounds	100%
Total Extractable Petroleum Hydrocarbons	100%
Pesticides	100%
Aroclor PCBs	100%
Congener PCBs	100%
Herbicides	100%
Polychlorinated dibenzo-*p*-dioxins and polychlorinated dibenzofurans	100%
Metals	100%
Cyanide	100%
2,4-Series Pesticides	100%
Total Organic Carbon	100%

1.5 Comparability

Comparability expresses the confidence with which one set of data can be compared with another to measure the same property. Data can be compared to the degree that their accuracy, precision, and representativeness are known and documented. Data are comparable if QC measures such as collection techniques, measurement procedures, analytical methods, and reporting units are equivalent for the samples being compared. Data subject to established quality assurance/quality control (QA/QC) measures are deemed more reliable and, therefore, more comparable, than data generated without such measures.

Consistent application of prescribed procedures was monitored throughout the Phase II RIWP program. Field and laboratory audits were used to assess conformance with the Phase II RIWP during sampling and analytical activities. Per Section 11.4 of the Phase II RIWP, field and laboratory audit reports are retained in the Newark Bay Project File. These audit reports can be provided by Tierra for review at USEPA's request. Likewise, specific data validation protocols were consistently applied to chemical and radiochemical data generated under this program to understand and document accuracy, precision and representativeness, thereby establishing comparability as defined above.

During data validation activities, analytical data were evaluated using a defined set of guidelines and acceptance criteria. In addition, data validation qualifiers were consistently applied to the analytical data generated during the Phase II RIWP program. When consistently applied, the data validation process serves to allow data comparability to be established between the Phase II RIWP and other data sets.

2. Phase II RIWP Data Validation and Qualification

2.1 Data Validation Status

Phase II RIWP analytical results were provided by the laboratories both electronically and in hard copy format. Upon receipt from the laboratory, results for specific analytical groups described below were validated by Environmental Data Services, Ltd. (EDS) as per the Section 13.2 of the Phase II RIWP using the following procedures:

Aroclor PCB data	USEPA Region 2 SOP No. HW-6, Revision 12, March 2001
Pesticides data	USEPA Region 2 SOP No. HW-6, Revision 12, March 2001
Semivolatile organics data	USEPA Region 2 SOP No. HW-6, Revision 12, March 2001
Herbicide data	USEPA Region 2 SOP No. HW-17, Revision 1.3, November 1994
Metals and cyanide data	USEPA Region 2 SOP No. HW-2, Revision 13, September 2005
Dioxin and furan isomer data	USEPA Region 2 SOP No. HW-25, Revision 2, September 1999
Volatile organics data	USEPA Region 2 SOP No. HW-6, Revision 12, March 2001

USEPA Region 2 did not have established validation standard operating procedures (SOPs) for radiochemical, congener PCB, TEPH, or TOC analyses at the time the Phase II RIWP was written and approved. Therefore, validation and qualification for these data types were specified in data validation SOPs prepared for this project. All validation SOPs (USEPA Region 2 and project-specific) that were used during the implementation of the Phase II RIWP are provided in Appendix H of the Phase II RIWP.

The Phase II RIWP sediment chemical and radiochemical data (as described above) underwent a full data validation process. This independent data validation process was described, in detail, in Section 13.2 of the Phase II RIWP. Based on the outcome of the data validation process, data validation qualifiers were added to the laboratory-reported sample results, as appropriate. The data validation qualifiers provide the data user with additional information about the usability of a given data point, the degree of certainty in the data, and indicate bias in a data point when assignment of bias is possible. The list of data validation qualifiers used to qualify data collected during the Phase II RIWP implementation is provided in Table 1 of this document.

2.2 Data Quality Issues and Data Qualification/Usability

Two types of data quality issues are discussed in this section, systematic data quality issues (Section 2.2.1) and random data quality issues (Section 2.2.2). Systematic data quality issues are those that are identified as having a consistent impact on the quality of numerous results reported (i.e., data quality of many samples and/or constituent classes are affected by a single data quality issue), due to a common circumstance or procedural application. While random data quality issues are those that impact the quality of results on a limited basis (i.e., data quality for a specific sample(s) and/or analyte(s) are affected by the data quality issue).

2.2.1 Systematic Data Quality Issues and Data Qualification

No systematic data quality issues were identified during the Phase II RIWP data validation task.

2.2.2 Random Data Quality Issues and Data Qualification

Many random data quality issues were identified during the Phase II RIWP data validation task. Random data quality issues and the resulting data qualification are discussed in Section 2.3 of this report.

2.3 Data Qualification/Usability Summarized by Constituent Class

The following discussion summarizes the data validation findings and associated qualifications related to random data quality issues for each constituent class. Note, no systematic data quality issues were identified during the data validation task. These validation findings have been separated into two distinct categories, major data quality issues and minor data quality issues.

Major data quality issues are those that result in the qualification of the analytical value reported as "R," or rejected. Rejection of a data point indicates that the analysis is invalid and provides no information as to whether the analyte is present or not. Data usability is distinguished based on the presence or absence of the "R" validation qualifier. Rejected data are not usable, while data that have not been rejected are usable.

Minor data quality issues include all other QA/QC issues identified during the data validation process that require sample results to be qualified, indicating a level or type of uncertainty associated with the reported result. Qualifiers applied to sample results were determined based on the data validation protocols specified in Section 13.2 of the Phase II RIWP.

Volatile Organic Compounds (VOCs)

The Phase II RIWP sediment VOC data set is comprised of 385 samples with 2,310 associated results.

Two major data quality issues were identified during validation of the Phase II RIWP sediment VOC analytical data. One sample exhibited a non-compliant internal standard area response of less than 25% of the daily standard, and several initial and continuing calibrations were found to have relative response factors for various target analyte VOCs that were extremely low (less than 0.05). The affected target analyte results were qualified as "R" (rejected/unusable).

Major Data Quality Issues				
Volatiles	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of VOC Results Affected**
Results qualified as unusable due to non-compliant internal standard area responses	Accuracy	1	4	0.17
Results qualified as unusable due to failure to meet calibration criteria	Accuracy	1	6	0.26

Five minor data quality issues were indentified in the Phase II RIWP sediment VOC data, they are described in the table below. Sample results affected by the minor data quality issues outlined below were qualified as "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate.

Minor Data Quality Issues				
Volatiles	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of VOC Results Affected**
Non-compliant field duplicate precision	Precision	2	2	0.09
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	3	3	0.13
Non-compliant surrogate standard recovery	Accuracy	23	62	2.7
Non-compliant internal standard area response	Accuracy	162	778	34
Exceeded holding times	Representativeness	1	6	0.26

Semivolatile Organic Compounds (SVOCs)

The Phase II RIWP sediment SVOC data set is comprised of 385 samples with 25,795 associated results.

Two major data quality issues were identified during validation of the Phase II RIWP sediment SVOC analytical data. One sample exhibited extremely low (less than 10%) recovery for pentachlorophenol during the matrix spike evaluation. Many other sample results were associated with initial and continuing calibrations with significant failures for specific analytes. Significant failures include relative response factors for various SVOCs that were extremely low (less than 0.05), and observed percent difference values between relative response factors in excess of 90%. The affected sediment SVOC results were qualified as "R" (rejected/unusable).

Major Data Quality Issues				
Semivolatiles	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of SVOC Results Affected**
Results qualified as unusable due to extremely low matrix spike recovery	Accuracy	1	1	0.01
Results qualified as unusable due to failure to meet calibration criteria	Accuracy	310	435	1.7

Nine minor data quality issues were identified in the Phase II RIWP sediment SVOC data and are listed in the table below. Sample results affected by the minor data quality issues outlined below were qualified as "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate.

Minor Data Quality Issues				
Semivolatiles	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of SVOC Results Affected**
Non-compliant initial and continuing calibration	Accuracy	354	844	3.3
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	12	14	0.05
Non compliant surrogate standard recovery	Accuracy	38	426	1.6
Non-compliant field duplicate precision	Precision	2	16	0.06
Exceeded holding time	Representativeness	4	63	0.24
Method blank contamination	Accuracy	133	285	1.1
Rinse blank contamination	Accuracy	12	72	0.28
Result concentration outside linear range	Accuracy	6	14	0.05
Non-compliant internal standard area response	Accuracy	103	685	2.7

Total Extractable Petroleum Hydrocarbons (TEPH)

The Phase II RIWP sediment TEPH data set is comprised of 385 samples with 385 associated results.

No major data quality issues were identified during validation of the Phase II RIWP sediment TEPH analyses.

Three minor data quality issues were identified and are listed in the table below. Sample results affected by the minor data quality issues outlined below were qualified as "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate.

Minor Data Quality Issues				
TEPH	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of TEPH Results Affected**
Non-compliant surrogate recovery	Accuracy	7	7	1.8
Exceeded holding time	Representativeness	1	1	0.26
Method blank contamination	Accuracy	35	35	9.1

Pesticides

The Phase II RIWP sediment Pesticides data set is comprised of 385 samples with 8,085 associated results.

Two major data quality issues were identified during validation of the Phase II RIWP pesticides analyses. Three samples exhibited peaks for identified target analytes that fell outside the retention time during second column confirmation. Many samples exhibited percent differences between results reported from

dual column analyses in excess of 200%. The affected target analyte results were flagged "R" (rejected/unusable).

Major Data Quality Issues				
Pesticides	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Pesticides Results Affected**
Failed retention time criteria	Accuracy	3	3	0.04
Percent difference between dual column results in excess of 200%	Precision	NC	230	2.8

NC = Not calculated
*Some results had greater than one major quality issue; therefore, the total # of "R" qualified results is less than the total number of results affected.

Seven minor data quality issues were identified and are listed in the table below. Sample results affected by the minor data quality issues as outlined below were qualified "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate with the following exceptions. In the case of minor data quality issue *Difference between results obtained from two analytical columns in excess of validation criteria*, the affected sample results were qualified as either "J" (estimated), or "NJ" (tentatively identified), for percent differences greater than 25% but less than 90% between results obtained from the two analytical columns; or "U" (not detected) at the project quantitation limit (PQL) for percent differences greater than 90% between results obtained from the two analytical columns when both values were less than the PQL.

Minor Data Quality Issues				
Pesticides	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Pesticides Results Affected**
Exceeded holding time	Representativeness	23	430	5.3
Non-compliant field duplicate precision	Precision	8	16	0.20

Aroclor PCBs

The Phase II RIWP sediment Aroclor PCB data set is comprised of 385 samples with 3,465 associated results.

One major data quality issue was identified during validation of the Phase II RIWP sediment Aroclor PCB analyses. Three results exhibited percent differences between results reported from dual column analyses in excess of 200%.

Major Data Quality Issues				
Aroclor PCBs	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Aroclor PCB Results Affected**
Percent difference between dual column results in excess of 200%	Accuracy	3	3	0.09

Five minor data quality issues were identified and are listed in the table below. Sample results affected by the minor data quality issues as outlined below were qualified "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate with the following exceptions. In the case of minor data quality issue *Difference between results obtained from two analytical columns in excess of validation criteria*, the affected sample results were qualified as either "J" (estimated), or "NJ" (tentatively identified), for percent differences greater than 25% but less than 90% between results obtained from the two analytical columns; or "U" (not detected) at the project quantitation limit (PQL) for percent differences greater than 90% between results obtained from the two analytical columns when both values were less than the PQL.

Minor Data Quality Issues				
Aroclor PCBs	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Aroclor PCB Results Affected**
Exceeded holding time	Representativeness	20	180	5.2
Non-compliant surrogate recoveries	Accuracy	11	99	2.9
Difference between results obtained from two analytical columns in excess of validation criteria	Precision	NC	180	5.2
Non-compliant precision for field duplicate	Precision	2	2	0.06
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	5	29	0.84

NC = Not calculated

Congener PCBs

The Phase II RIWP sediment Congener PCBs data set is comprised of 385 samples with 64,680 associated results.

One major data quality issue was identified during validation of the Phase II RIWP sediment Congener PCBs analyses. One hundred and ten samples had positive results reported when relative retention time criteria were not met. The associated target analyte results were qualified as "R" (rejected/unusable).

Major Data Quality Issues				
Congener PCBs	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Congener PCB Results Affected**
Failed relative retention time criteria	Accuracy	110	186	0.29

Nine minor data quality issues were identified and are listed in the table below. Sample results associated with these minor data quality issues were qualified as "J" (estimated) or "EMPC" (estimated maximum possible concentration), as appropriate.

Minor Data Quality Issues				
Congener PCBs	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Congener PCB Results Affected**
Method blank contamination	Accuracy	104	194	0.30
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	15	131	0.20
Non-compliant precision for a field duplicate	Precision	20	203	0.31
Non-compliant labeled recovery standard area response	Accuracy	140	9,357	14
Interferences affecting accurate quantitation of PCB-81	Representativeness	285	285	0.44
Exceeded holding times	Representativeness	21	3,526	5.5
Interferences affecting accurate quantitation of PCB-159	Representativeness	5	5	0.01
Value exceeded established linear range	Accuracy	1	13	0.02
Non-compliant internal standard recoveries	Accuracy	7	11	0.02

Herbicides

The Phase II RIWP sediment Herbicide data set is comprised of 385 samples with 1,540 associated results.

Four major data quality issues were identified during validation of the Phase II RIWP sediment herbicide analyses. Sample results associated with these major data quality issues were qualified as "R" (rejectable/unusable). The major data quality issues identified are described below.

Major Data Quality Issues				
Herbicides	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Herbicides Results Affected**
Percent difference between dual column results in excess of 200%	Precision	NC	366	24
Failed retention time criteria	Accuracy	3	3	0.19
Extremely low matrix spike/matrix spike duplicate recovery	Accuracy	3	4	0.26
Extremely low lab control sample recovery (<10%)	Accuracy	20	80	5.2

NC = Not calculated
*Some results had greater than one major quality issue; therefore, the total # of "R" qualified results is less than the total number of results affected.

Ten minor data quality issues were identified and are listed in the table below. Sample results affected by the minor data quality issues as outlined below were qualified as either "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate with the following exceptions. In the case of minor data quality issue *Difference between results obtained from two analytical columns in excess of validation criteria*, the affected sample results were qualified as either "J" (estimated), or "NJ" (tentatively identified), for percent differences greater than 25% but less than 90% between results obtained from the two analytical columns; or "U" (not detected) at the project quantitation limit (PQL) for percent differences greater than 90% between results obtained from the two analytical columns when both values were less than the PQL.

Minor Data Quality Issues				
Herbicides	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Herbicides Results Affected**
Non-compliant initial and continuing calibrations	Accuracy	38	56	3.6
Non-compliant laboratory control sample recovery	Accuracy	47	107	6.9
Non-compliant surrogate recoveries	Accuracy	147	503	33
Difference between results obtained from two analytical columns in excess of validation criteria	Precision	NC	562	36
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	5	9	0.58
Field blank contamination	Accuracy	3	3	0.19
Method blank contamination	Accuracy	54	55	3.6
Non-compliant field duplicate precision	Precision	1	1	0.06
Exceeded holding times	Representativeness	2	5	0.32
Interferences observed (co-eluting signal)	Accuracy	3	3	0.19

NC = Not calculated

Polychlorinated dibenzo-*p*-dioxins and furans (PCDDs/PCDFs)

The Phase II RIWP sediment PCDD/PCDF data set is comprised of 385 samples with 6,545 associated results.

No major data quality issues were identified during validation of the Phase II RIWP sediment PCDDs/PCDFs analyses.

Six minor data quality issues were identified and are listed in the table below. Sample results associated with these minor data quality issues were qualified as "J" (estimated) with bias indicated where appropriate or "EMPC" (estimated maximum possible concentration), as appropriate.

Minor Data Quality Issues				
PCDDs/PCDFs	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of PCDDs/PCDFs Results Affected**
Non-compliant internal standard recovery	Accuracy	55	77	1.2
Non-compliant matrix spike/matrix spike duplicate recovery	Accuracy	6	8	0.12
Exceeded holding time	Representativeness	32	544	8.3
Method blank contamination	Accuracy	28	41	0.63
Non-compliant labeled analog standard recovery	Accuracy	4	4	0.06
Presence of a corresponding chlorinated diphenyl ether peak when a positive PCDF was identified	Representativeness	208	253	3.9

Metals

The Phase II RIWP sediment Metals data set is comprised of 385 samples with 9,240 associated results.

One major data quality issue was identified during validation of the Phase II RIWP sediment metals data that resulted in "R" qualification (rejected/unusable) of specific metals data. Sixty-nine samples were associated with an extremely poor matrix spike recovery (below 10% or above 200%).

Major Data Quality Issues				
Metals	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Metals Results Affected**
Extremely poor matrix spike recovery	Accuracy	69	69	0.75

Six minor data quality issues were identified and are listed in the table below. Sample results associated with these minor data quality issues were qualified as "J" (estimated) with bias indicated where appropriate and/or "U" (not detected), as appropriate.

Minor Data Quality Issues				
Metals	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Metals Results Affected**
Non-compliant ICP interference check sample	Accuracy	4	8	0.09
Serial dilution determination result outside validation acceptance range	Representativeness	286	1,286	14
Non-compliant matrix spike recovery	Accuracy	366	1,452	16
Poor laboratory duplicate precision	Precision	35	35	0.38
Method/Calibration/Instrument blank contamination	Accuracy	364	597	6.5
Non-compliant internal standard recovery	Accuracy	131	155	1.7

Cyanide

The Phase II RIWP sediment Cyanide data set is comprised of 385 samples with 385 associated results.

No major data quality issues were identified during validation of the Phase II RIWP sediment cyanide analyses.

Three minor data quality issues were identified and are listed in the table below. Sample results associated with these minor data quality issues were qualified as "J" (estimated) with bias indicated where appropriate and/or "U" (not detected), as appropriate.

Minor Data Quality Issues				
Cyanide	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Cyanide Results Affected**
Serial dilution determination result outside validation acceptance range	Representativeness	10	10	2.6
Non-compliant matrix spike recovery	Accuracy	182	182	47
Method/Calibration/Instrument blank contamination	Accuracy	11	53	14

2,4-Series Pesticides

The Phase II RIWP sediment 2,4-Series Pesticides data set is comprised of 385 samples with 1,155 associated results.

Two major data quality issues were identified during validation of the Phase II RIWP sediment 2,4-Series Pesticides analyses. First, several samples exhibited percent differences between results reported from dual column analyses in excess of 200%. Second, two sample results were based on chromatographic peaks which had shifted outside the established retention time window, and thereby did not meet identification criteria. The affected target analyte results were qualified as "R" (rejected/unusable).

Major Data Quality Issues				
2,4-Series Pesticides	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of 2,4-Series Pesticides Results Affected**
Percent difference between dual column results in excess of 200%	Precision	NC	27	2.3
Failed identification criteria	Accuracy	1	2	0.17

NC = Not calculated

Two minor data quality issues were identified and are listed in the table below. Sample results affected by the minor data quality issues as outlined below were qualified "J" (estimated) with bias indicated where appropriate and/or "U" (not detected) as appropriate with the following exceptions. In the case of minor data quality issue *Difference between results obtained from two analytical columns in excess of validation criteria*, the affected sample results were qualified as either "J" (estimated), or "NJ" (tentatively identified), for percent differences greater than 25% but less than 90% between results obtained from the two analytical columns; or "U" (not detected) at the project quantitation limit (PQL) for percent differences greater than 90% between results obtained from the two analytical columns when both values were less than the PQL.

Minor Data Quality Issues				
2.4-Series Pesticides	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of 2,4-Series Pesticides Results Affected**
Exceeded holding time	Representativeness	28	69	6.0
Difference between results obtained from two analytical columns in excess of validation criteria	Precision	NC	588	51

NC = Not calculated

TOC

The Phase II RIWP sediment TOC data set is comprised of 385 samples with 385 associated results.

No major data quality issues were identified during validation of the Phase II RIWP TOC analyses.

Two minor data quality issues were identified and are listed in the table below. Sample results affected by the minor data quality issues were qualified as "J" (estimated) with bias indicated where appropriate, and/or "U" (not detected) as appropriate.

Minor Data Quality Issues				
TOC	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of TOC Results Affected**
Non-compliant matrix spike recovery	Accuracy	1	1	0.26
Method blank contamination	Accuracy	3	3	0.78

Radiochemical

The Phase II RIWP sediment lead-210/cesium-137 (Pb-210/Cs-137) data set is comprised of 426 samples with 852 associated results.

No major data quality issues were identified during validation of the Phase II RIWP lead-210/cesium-137 analyses.

One minor data quality issue was identified for Pb-210 and is listed in the table below. The sample result affected by the minor data quality issue was qualified as "JL" (estimated potential low bias).

Minor Data Quality Issues				
Pb-210	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Pb-210 Results Affected**
Non-compliant matrix spike recovery	Accuracy	1	1	0.23

The Phase II RIWP sediment beryllium-7 (Be-7) data set is comprised of 64 samples with 64 associated results.

No major data quality issues were identified during validation of the Phase II RIWP beryllium-7 analyses.

One minor data quality issue was identified and is listed in the table below. The sample result affected was outside the holding time and was qualified as "J" (estimated).

Minor Data Quality Issues				
Be-7	**Data Quality Parameter Affected**	**Number of Samples Affected**	**Number of Results Affected**	**% of Be-7 Results Affected**
Exceeded holding time	Representativeness	1	1	1.6

2.4 Miscellaneous Data Qualification

Moisture Content

Moisture content greater than 50% is not uncommon for sediment samples. Per the Phase II RIWP, an "M" flag was applied during data validation when a sample was found to contain between 50% and 90% moisture and no other data quality issues were identified that required data qualification. Sixty percent of the total chemical sediment sample results which were analyzed on a wet weight basis had observed moisture content values observed to be between 50 and 90%. Therefore the data validation qualifier most frequently applied to the Phase II RIWP sediment data set was the "M" flag.

Table 1
Data Validation Qualifiers

Qualifier	Description
J	Estimated value (bias undetermined) – The analyte was positively identified; but the associated numerical value is the approximate concentration of the analyte in the sample.
JH	Estimated value (potential high bias) – The analyte was positively identified; but the associated numerical value is the approximate concentration, with a potential high bias, of the analyte in the sample.
JL	Estimated value (potential low bias) – The analyte was positively identified; but the associated numerical value is the approximate concentration, with a potential low bias, of the analyte in the sample.
UJ	Estimated non-detect - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
UJL	Estimated non-detect (potential low bias) – The analyte was not detected and the report sample quantitation limit is biased low.
UJH	Estimated non-detect (potential high bias) – The analyte was not detected and the reported sample quantitation limit is biased high.
M	The analytical result reported was obtained from a sediment sample found to contain between 50 and 90 percent moisture and had no other data qualifiers added during the data validating process.
NJ	The organic analysis indicates the presence of an analyte that has been “tentatively identified” and the associated numerical value represents its approximate concentration.
NJH	The organic analysis indicates the presence of an analyte that has been “tentatively identified” and the associated numerical value represents its approximate concentration with a potential high bias, of the analyte concentration.
EMPC	Estimated Maximum Possible Concentration (EMPC).
R	The sample results are rejected. Due to a significant QA/QC problem, the analysis is invalid and provides no information as to whether the analyte is present or not.
U	Non-detect -The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

Attention: Ms. Elizabeth Butler
Remedial Project Manager

Re: Administrative Order on Consent, U.S.E.P.A. Index No. CERLCA-02-2004-2010 for *Newark Bay Study Area – Phase II Remedial Investigation – Results of Performance Evaluation Sample Program*

Dear Ms. Butler:

Tierra Solutions, Inc. [funding and performing, on behalf of Occidental Chemical Corporation, the subject Administrative Order On Consent Newark Bay AOC] (Tierra) has completed the Newark Bay Study Area (NBSA) Phase II Remedial Investigation Work Plan (RIWP) Performance Evaluation (PE) sample program as outlined in the USEPA approved memorandum entitled SRM 2007 (see attached). The laboratory results reported for each of the PE sample studies as well as associated certified reference values, and acceptance criteria are enclosed.

Project specified laboratories, as approved by USEPA for use during the Phase II RI, participated in this evaluation program as indicated below.

Laboratory	PE Sample	Analytical Group
Vista Analytical Laboratory, Inc. El Dorado Hills, California	WMS-01	Dioxin/Furan
	EDF-5183	Dioxin/Furan
	NIST 1944	Congener PCBs
TestAmerica Analytical Testing Corp. South Burlington, Vermont	D055-727	Semivolatile Organics
	D059-728	Pesticides
	D056-540	Metals

10th Floor
Two Tower Center Blvd. East Brunswick, New Jersey 08816

As illustrated in the comparison tables attached and in accordance with acceptance criteria governing the applied PE samples, the laboratories have demonstrated their ability to proficiently analyze NBSA Phase II RI field samples.

If you have any questions regarding the enclosed material, please feel free to contact me at 732-246-3091.

Sincerely,

Tierra Solutions, Inc.

Paul J. Bluestein, P.E.
Facility Coordinator
On behalf of Occidental Chemical Corporation
(as successor to Diamond Shamrock Chemicals Company)

WELLINGTON LABORATORIES INC.
Certified Reference Material

WMS-01 is a homogeneous lake sediment that is "naturally" contaminated and not fortified.

It is to be used to assess the performance of an analytical laboratory for the parameters listed.

Preparation

The crude, untreated sediment used to prepare WMS-01 was collected from Lake Ontario. The sediment obtained was subsequently air-dried, crushed to break up agglomerates, air-dried again and then sieved, milled and re-sieved (100% less than 75 µm).

The sediment was then subsampled into pre-cleaned, amber glass bottles, 25 g per bottle, and labeled.

Testing

Homogeneity
The first tests for homogeneity involved the analysis for metals by neutron activation. For this purpose, two splits from each of 22 bottles were analyzed. For the 18 elements used, there was no evidence of inhomogeneity.

To test for homogeneity for organic materials, 44 randomly selected samples were analyzed for Total Organic Carbon (TOC) by coulometry. As with the metals, the TOC showed that there was no evidence of inhomogeneity.

In addition, PAH data obtained in 1991 through an interlaboratory study, also indicated that the sediment was very homogeneous.

Interlaboratory Certification
In the fall of 1999, an international interlaboratory study was conducted to obtain consensus values for chlorinated dibenzo-p-dioxins (PCDDs), dibenzofurans (PCDFs) and "dioxin-like" chlorinated biphenyls (PCBs). In this study, thirty-seven laboratories from 17 countries participated[1].

The results obtained from this study were used to assign the certified reference values.

Certain data are provisional and are provided for information purposes only. As more analyses are performed, these may be updated and certified values assigned.

Storage and Handling

WMS-01 is for laboratory use only and should be handled by personnel trained in the processing of potentially hazardous materials. The absence of a warning on any of our products must not be interpreted as an indication that there is no possible health hazard.

When not in use, it should be stored in a well-sealed container in the dark at 4°C. The recommended minimum sample size is 1.0 gram.

Expiry Date

In the unopened bottle, the current expiry date for WMS-01 is **12/01/2008**.

Wellington will regularly reanalyze random subsamples of this sediment to determine if there has been any loss or degradation of the target analytes.

Warranty

At the time of shipment, this product is warranted to conform to the analytical specifications as given. Wellington makes no other warranty, expressed or implied, pertaining to the suitability of this product for any specific application.

Certificate of Analysis

Clean Soil Reference Material 2003

Catalog Number:	EDF-5183
Lot Number:	ER051603-01
Expiration Date:	August 2016
Matrix:	Soil
Amount per Vial:	10 g
Storage and Handling:	This product contains trace amounts of dioxins, furans, PCBs, BFRs, PAHs, and pesticides. It should be handled according to OSHA guidelines for hazardous material. Freezer. Protect from light.
Intended Use:	For laboratory use only. This product is a sample of homogeneous soil matrix taken from an area where no known chemical contamination has occurred. This sample is intended for use in evaluating the performance of an analytical laboratory for the listed analytes.
Preparation:	"Clean" soil was obtained from a location in Texas which was expected to contain minimal contamination. The soil was sieved to achieve uniform particle size and homogenized to within 5% using a disodium fluorescein indicator. Samples were then sterilized three times for two hours at 121°C and 15 psi.
Interlaboratory Analysis:	This product was included in the Second Round of International Interlaboratory Study conducted by Cambridge Isotope Laboratories and Cerilliant Corporation. Participating laboratories used a variety of sample preparation and analytical techniques. The results listed below supersede those obtained in the First Round of Interlaboratory Study. This Second Round of Interlaboratory Study adds consensus values for one new dioxin, seventeen new PCBs, ten BDEs, and two new PAHs.
Interlaboratory Results:	Results of the international interlaboratory study are attached. Consensus values were independently assigned by the Quasimeme Group (UK) using the Cofino model of statistical analysis. These numbers are certified reference values. All values are presented at three significant figures. Analytes with fewer than five laboratories contributing acceptable data do not have assigned values reported in this study.

Cerilliant certifies that this standard meets or exceeds the specifications stated in this data sheet.

[1] ERA = Environmental Resource Associates

[2] Certified Reference Values used for this study are based on those provided on the ERA certification. Associated acceptance limits were chosen from the certification "QC Performance Acceptance Limits" as they represent an approximation of the 95% confidence interval of the performance that experienced laboratories should achieve using acceptable environmental methods. This acceptance criteria is consistent with that provided for in the SRM 2007, July 25, 2007 memo outlining the implementation of this project specific performance evaluation sample program.

[3] LAL = Lower Acceptance Limit

The Certified Values are the actual 'made-to' concentrations confirmed by ERA analytical verification.

The QC Performance Acceptance Limits (QC PALs™) are based on actual historical data collected in ERA's Proficiency Testing program. The **QC PALs™** reflect any inherent biases in the methods used to establish the limits and closely approximate a 95% confidence interval of the performance that experienced laboratories should achieve using accepted environmental methods. Use the **QC PALs™** to realistically evaluate your performance against your peers.

The PT Performance Acceptance Limits (PT PALs™) are calculated using the regression equations and fixed acceptance criteria specified in the USEPA National Standards Criteria Document and/or the NELAC proficiency testing requirements. Use the **PT PALs™** when analyzing this QC standard alongside USEPA and NELAC compliant PT standards. Please note that many PT study acceptance limits are concentration dependent (some non-linearly) and, therefore, the acceptance limits of this QC standard and any PT standard may differ relative to their difference in concentrations.

Please call ERA at 1-800-372-0122 if you have any questions or need technical assistance.

6000 West 54th Ave., Arvada, CO 80002 1-800-372-0122 fax 303-421-0159 info@eraqc.com www.eraqc.com

[1] ERA = Environmental Resource Associates

[2] Certified Reference Values used for this study are based on information provided by ERA in advance of publication of the typical "ERA certification" documentation (see attached). The material used for this study was recently prepared and the associated official "ERA certificate" is not currently available. Acceptance criteria are set at the 95% confidence interval of the performance that experienced laboratories should achieve using acceptable environmental methods (i.e., Historical Data ± 2SD). This acceptance criteria is consistent with that provided for in the SRM 2007, July 25, 2007 memo outlining the implementation of this project specific performance evaluation sample program.

[3] LAL = Lower Acceptance Limit

[4] UAL = Upper Acceptance Limit

[2] Certified Reference Values used for this study are based on those provided on the ERA certification for samples digested using HN03, H202 and HCL. These reference values were selected since these solutions were used to digest the PE sample analyzed during this study. Further all future field samples collected during NBSA Phase II RIWP implementation will be prepared in this manner per USEPA CLP ILM06.X.

D.L. = detection limit

(1) **Total Concentrations** are equal to the background concentrations in the soil matrix (measured using neutron activation, XRF and total digestion techniques) plus the amount of each analyte spiked onto the soil. For Trace Metals, the values listed are only "theoretical values" based upon using the methodologies listed.

(2) **Certified Values** are equal to the mean recoveries for each parameter as determined in an interlaboratory round robin study using the digestions and analytical techniques listed. Mercury results were obtained using Cold Vapor Atomic Absorption, Atomic Fluorescence and ICP-MS methodologies. All certified values are based on an "as received" basis, assuming a 100% solids content.

(3) **The Performance Acceptance Limits (PALs™)** are listed as guidelines for acceptable analytical results given the limitations of the USEPA methodologies commonly used to determine these parameters and closely approximate the 95% confidence interval. The PALs™ are based on data generated by your peer laboratories in ERA's Interlab™ programs. If your result falls outside of the PALs™, ERA recommends that you investigate potential sources of error in your preparation and/or analytical procedures. For further technical assistance, call ERA at 1-800-372-0122.

(4) **This standard expires 7/2009.** The expiration date was determined using an ERA procedure based on ASTM standard practice D 4841-88. The expiration date is valid when the ERA standards have been stored following the directions provided in the ERA instructions that accompany this product.

* These parameters are native matrix elements and are present at high concentrations in the unspiked soil. As methods 3050 and 3051 do not normally dissolve elements bound in silicate structures, the recoveries of these elements will be low relative to the recoveries of the elements that are primarily spiked onto the soil.

NOTE: For laboratories that use internal standards in their analysis procedures, the following elements have been measured in this standard at the listed concentrations. (Note: these concentrations are for informational use only and do not represent "Certified Values". Ce - 61.5 mg/Kg; La - 35.5 mg/Kg; Y - 11.4 mg/Kg.)

[1] NIST - National Institute of Standards and Technology

[2] Certified Reference Values are provided based on the NIST Certificate of Analysis. However, the specific compounds evaluated in this study are those provided for in the SRM 2007 memo dated July 25, 2007. Note, acceptance criteria used to evaluate this study are also provided for in the SRM 2007 memo. Acceptance criteria have been defined as follows:

- Acceptance ranges will be +/- 30% of the certified reference value listed in the table above.

- Up to three of the eighteen Congener PCBs listed above may have laboratory results fall outside the established acceptance range during implementation of this PE program so long as no individual result reported exceeds a limit of +/- 50% of the certified reference value.

[3] LAL = Lower Acceptance Limit

[4] UAL = Upper Acceptance Limit

[5] Per the acceptance criteria listed in footnote number 2 above, the reported result is greater than 30% of the certified reference value. However, it does not differ by more than 50%. Therefore, the overall study is acceptable even though this particular value does not fall within the +/- 30% acceptance window.

National Institute of Standards & Technology

Certificate of Analysis

Standard Reference Material® 1944

New York/New Jersey Waterway Sediment

Standard Reference Material (SRM) 1944 is a mixture of marine sediment collected near urban areas in New York and New Jersey. SRM 1944 is intended for use in evaluating analytical methods for the determination of selected polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyl (PCB) congeners, chlorinated pesticides, and trace elements in marine sediment and similar matrices. Reference values are also provided for selected dibenzo-*p*-dioxin and dibenzofuran congeners, total organic carbon, total extractable material, and particle-size characteristics. All of the constituents for which certified, reference, and information values are provided in SRM 1944 were naturally present in the sediment material before processing. A unit of SRM 1944 consists of a bottle containing 50 g of radiation sterilized, freeze-dried sediment material.

Certified Concentration Values: Certified values for concentrations, expressed as mass fractions, for 24 PAHs, 35 PCB congeners (some in combination), four chlorinated pesticides, and nine trace elements are provided in Tables 1-4. A NIST certified value is a value for which NIST has the highest confidence in its accuracy in that all known or suspected sources of bias have been investigated or accounted for by NIST. The certified values for the PAHs, PCB congeners, and chlorinated pesticides are based on the agreement of results obtained at NIST from two or more chemically independent analytical techniques. The certified values for the trace elements are based on NIST measurements by one technique and additional results from several collaborating laboratories.

Reference Concentration Values: Reference values for concentrations, expressed as mass fractions, are provided for 32 additional PAHs (some in combination) in Table 5, seven additional chlorinated pesticides in Table 6, and 19 additional inorganic constituents in Tables 7 and 8. Reference values are provided in Table 9 for the 17 2,3,7,8-substituted polychlorinated dibenzo-*p*-dioxin and dibenzofuran congeners and total tetra-, penta-, hexa-, and hepta-congeners of polychlorinated dibenzo-*p*-dioxin and dibenzofuran. Reference values for particle-size characteristics are provided in Table 10. Reference values for total organic carbon and percent extractable mass are provided in Table 11. Reference values are noncertified values that are the best estimate of the true value; however, the values do not meet the NIST criteria for certification and are provided with associated uncertainties that may reflect only measurement precision, may not include all sources of uncertainty, or may reflect a lack of sufficient statistical agreement among multiple analytical methods. Explanations in support of each reference value are given as notes in Tables 5-11.

Information Concentration Values: Information values for concentrations, expressed as mass fractions, are provided in Table 12 for eight additional trace elements. An information value is considered to be a value that will be of interest and use to the SRM user, but insufficient information is available to assess the uncertainty associated with the value or only a limited number of analyses were performed.

Expiration of Certification: The certification of this SRM lot is valid until **31 March 2009**, within the measurement uncertainties specified, provided the SRM is handled and stored in accordance with the instructions given in this certificate. However, the certification is nullified if the SRM is damaged, contaminated, or modified.

The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program by B.S. MacDonald.

Willie E. May, Chief
Analytical Chemistry Division

Gaithersburg, MD 20899
Certificate Issue Date: 14 May 1999

Thomas E. Gills, Director
Office of Measurement Services

Maintenance of SRM Certification: NIST will monitor this SRM over the period of its certification. If substantive technical changes occur that affect the certification before the expiration of this certificate, NIST will notify the purchaser. Return of the attached registration card will facilitate notification.

The coordination of the technical measurements leading to the certification was under the leadership of S.A. Wise of the NIST Analytical Chemistry Division.

Consultation on the statistical design of the experimental work and evaluation of the data were provided by M.G. Vangel and M.S. Levenson of the NIST Statistical Engineering Division.

The sediment material was collected with the assistance of the New York District of the U.S. Army Corp of Engineers (ACENYD), who provided the expertise in the site selection, the ship, sampling equipment, and personnel. L. Rosman of ACENYD and R. Parris (NIST) coordinated the collection of this sediment material. Collection and preparation of SRM 1944 were performed by R. Parris, M. Cronise, and C. Fales (NIST); L. Rosman and P. Higgins (ACENYD); and the crew of the *Gelberman* from the ACE Caven Point facility in Caven Point, NJ.

Analytical measurements for the certification of SRM 1944 were performed at NIST by E.S. Beary, D.A. Becker, R. Demiralp, R.R. Greenberg, M. Lopez de Alda, K.E. Murphy, B.J. Porter, D.L. Poster, L.C. Sander, M.M. Schantz, and L. Walton of the Analytical Chemistry Division. Measurements for percent total organic carbon measurements were provided by three commercial laboratories and T.L. Wade of the Geochemical and Environmental Research Group, Texas A&M University (College Station, TX). The particle-size distribution data were provided by Honeywell, Inc. (Clearwater, FL).

Analytical measurements for the polychlorinated dibenzo-*p*-dioxins and dibenzofurans were the results of an interlaboratory comparison study among 14 laboratories (see Appendix A) coordinated by S.A. Wise of the NIST Analytical Chemistry Division and R. Turle and C. Chiu of Environment Canada, Environmental Technology Centre, Analysis and Air Quality Division (Ottawa, Ontario, Canada). Analytical measurements for selected trace elements were provided by the International Atomic Energy Agency (IAEA, Seibersdorf, Austria) by M. Makarewicz and R. Zeisler. Results were also used from seven laboratories (see Appendix B) that participated in an intercomparison exercise coordinated by S. Willie of the Institute for National Measurement Standards, National Research Council Canada (NRCC, Ottawa, Ontario, Canada).

NOTICE AND WARNING TO USERS

Storage: SRM 1944 must be stored in its original bottle at temperatures less than 30 °C away from direct sunlight.

Handling: This material is naturally occurring marine sediment from an urban area and may contain constituents of unknown toxicities; therefore, caution and care should be exercised during its handling and use.

Instructions for Use: Prior to removal of subsamples for analysis, the contents of the bottle should be mixed. The concentrations of constituents in SRM 1944 are reported on a dry-mass basis. The SRM, as received, contains approximately 1.3 % moisture. The sediment sample should be dried to a constant mass before weighing for analysis, or if the constituents of interest are volatile, a separate subsample of the sediment should be removed from the bottle at the time of analysis and dried to determine the concentration on a dry-mass basis.

PREPARATION AND ANALYSIS[1]

Sample Collection and Preparation: The sediment used to prepare this SRM was collected from six sites in the vicinity of New York Bay and Newark Bay in October 1994. Site selection was based on contaminant levels measured in previous samples from these sites and was intended to provide relatively high concentrations for a variety of chemical classes of contaminants. The sediment was collected using an epoxy-coated modified Van Veen-type grab sampler designed to sample the sediment to a depth of 10 cm. A total of approximately 2100 kg of wet sediment was collected from the six sites. The sediment was freeze-dried, sieved (nominally 250 μm to 61 μm), homogenized in a cone blender, radiation sterilized (^{60}Co), and then packaged in screw-capped amber glass bottles.

[1]Certain commercial equipment, instrumentation, or materials are identified in this report to specify adequately the experimental procedure. Such identification does not imply recommendation or endorsement by the NIST, nor does it imply that the materials or equipment identified are necessarily the best available for the purpose.

Conversion to Dry-Mass Basis: The results for the constituents in SRM 1944 are reported on a dry-mass basis; however, the material "as received" contains residual moisture. The amount of moisture in SRM 1944 was determined by measuring the mass loss after freeze-drying subsamples of 1.6 g to 2.5 g for five days at 1 Pa with a -10 °C shelf temperature and a -50 °C condenser temperature. The moisture content in SRM 1944 at the time of the certification analyses was 1.25 % ± 0.03 % (95 % confidence level).

Polycyclic Aromatic Hydrocarbons: The general approach used for the value assignment of the PAHs in SRM 1944 was similar to that reported for the recent certification of several environmental matrix SRMs [1-5] and consisted of combining results from analyses using various combinations of different extraction techniques and solvents, cleanup/isolation procedures, and chromatographic separation and detection techniques. This approach consisted of Soxhlet extraction and pressurized fluid extraction (PFE) using dichloromethane (DCM) or a hexane/acetone mixture, cleanup of the extracts using solid phase extraction (SPE) or normal-phase liquid chromatography (LC), followed by analysis using the following techniques: (1) reversed-phase liquid chromatography with fluorescence detection (LC-FL) for analysis of the total PAH fraction, (2) reversed-phase LC-FL analysis of isomeric PAH fractions isolated by normal-phase LC (i.e., multidimensional LC), (3) gas chromatography/mass spectrometric (GC/MS) analysis of the PAH fraction on three stationary phases of different selectivity, i.e., a 5 % (mole fraction) phenyl-substituted methylpolysiloxane phase, a 50 % (mole fraction) phenyl-substituted methylpolysiloxane phase, and a smectic liquid crystalline stationary phase.

Six sets of GC/MS results, designated as GC/MS (I), GC/MS (II), GC/MS (III), GC/MS (IV), GC/MS (V), and GC/MS (Sm), were obtained using three columns with different selectivities for the separation of PAHs. For GC/MS (I) analyses, duplicate subsamples of 1 g from eight bottles of SRM 1944 were Soxhlet extracted for 24 h with DCM. Copper powder was added to the extract to remove elemental sulfur. The concentrated extract was passed through a silica SPE cartridge and eluted with 2 % DCM in hexane. The processed extract was then analyzed by GC/MS using a 0.25 mm i.d. x 60 m fused silica capillary column with a 5 % phenyl-substituted methylpolysiloxane phase (0.25 µm film thickness) (DB-5 MS, J&W Scientific, Folsom, CA). The GC/MS (II) analyses were performed using 1 g to 2 g subsamples from three bottles of SRM 1944 and 2 g to 3 g subsamples from three bottles of SRM 1944 that had been mixed with a similar amount of water (i.e., a wetted sediment). These samples were Soxhlet extracted with DCM and processed through the silica SPE as described above; however, the extract was further fractionated using normal-phase LC on a semi-preparative aminopropylsilane column to isolate the PAH fraction [6-9]. The PAH fraction was then analyzed using the same column as described above for GC/MS (I); however, the subsamples were extracted, processed and analyzed as part of three different sample sets at different times using different calibrations for each set. For the GC/MS (III), 1 g to 2 g subsamples from six bottles of SRM 1944 were Soxhlet extracted for 18 h with 250 mL of a mixture of 50 % hexane/50 % acetone (volume fractions). The extracts were then processed and analyzed as described for GC/MS (II). For GC/MS (IV) analyses, 1 g to 2 g subsamples from six bottles of SRM 1944 were extracted using PFE with a mixture of 50 % hexane/50 % acetone as described by Schantz et al. [10], and the extracts were processed as described above for GC/MS (II). The GC/MS (V) results were obtained by analyzing three of the same PAH fractions that were analyzed in GC/MS (III) and three of the PAH fractions that were analyzed in GC/MS (IV) using a 50 % phenyl-substituted methylpolysiloxane stationary phase (0.25 mm i.d. x 60 m, 0.25 µm film thickness) (DB-17MS, J&W Scientific, Folsom, CA). For GC/MS (Sm) 1 g to 2 g subsamples from six bottles of SRM 1944 were Soxhlet extracted for 24 h with 250 mL of DCM. The extracts were processed as described above for GC/MS (I) using an aminopropylsilane SPE cartridge followed by GC/MS analysis using 0.2 mm i.d. x 25 m (0.15 µm film thickness) smectic liquid crystalline phase (SB-Smectic, Dionex, Lee Scientific Division, Salt Lake City, UT).

Two sets of LC-FL results, designated as LC-FL (Total) and LC-FL (Fraction), were used in the certification process. Subsamples of approximately 1 g from six bottles of SRM 1944 were Soxhlet extracted for 20 h using 200 mL of 50 % hexane/50 % acetone (volume fractions). The extracts were concentrated and then processed through two aminopropylsilane solid phase extraction (SPE) cartridges connected in series to obtain the total PAH fraction. A second 1 g subsample from the six bottles was Soxhlet extracted and processed as described above; the PAH fraction was then fractionated further on a semi-preparative aminopropylsilane column (µBondapak NH_2, 9 mm i.d. x 30 cm, Waters Associates, Milford, MA) to isolate isomeric PAH fractions as described previously [6-9]. The total PAH fraction and the isomeric PAH fractions were analyzed using a 5-µm particle-size polymeric octadecylsilane (C_{18}) column (4.6 mm i.d. x 25 cm, Hypersil-PAH, Keystone Scientific, Inc., Bellefonte, PA) with wavelength programmed fluorescence detection [7,8]. For all of the GC/MS and LC-FL measurements described above, selected perdeuterated PAHs were added to the sediment prior to solvent extraction for use as internal standards for quantification purposes.

Homogeneity Assessment for PAHs: The homogeneity of SRM 1944 was assessed by analyzing duplicate samples of 1 g from eight bottles selected by stratified random sampling. Samples were extracted, processed, and analyzed as

described above for GC/MS (I). No statistically significant differences among bottles were observed for the PAHs at the 1 g sample size.

PCBs and Chlorinated Pesticides: The general approach used for the determination of PCBs and chlorinated pesticides in SRM 1944 was similar to that reported for the recent certification of several environmental matrix SRMs [2,4,11,12,13], and consisted of combining results from analyses using various combinations of different extraction techniques and solvents, cleanup/isolation procedures, and chromatographic separation and detection techniques. This approach consisted of Soxhlet extraction and PFE using DCM or a hexane/acetone mixture, cleanup/isolation using SPE or LC, followed by analysis using GC/MS and gas chromatography with electron capture detection (GC-ECD) on two columns with different selectivity.

Eight sets of results were obtained designated as GC-ECD (I) A and B, GC-ECD (II) A and B, GC/MS (I), GC/MS (II), GC/MS (III), and QA Exercise. For the GC-ECD (I) analyses, 1 g subsamples from four bottles of SRM 1944 were Soxhlet extracted with DCM for 18 h. Copper powder was added to the extract to remove elemental sulfur. The concentrated extract was passed through a silica SPE cartridge and eluted with 10 % DCM in hexane. The concentrated eluant was then fractionated on a semi-preparative aminopropylsilane column to isolate two fractions containing: (1) the PCBs and lower polarity pesticides, and (2) the more polar pesticides. GC-ECD analyses of the two fractions were performed on two columns of different selectivities for PCB separations: 0.25 mm x 60 m fused silica capillary column with a 5 % phenyl-substituted methylpolysiloxane phase (0.25 µm film thickness) (DB-5, J&W Scientific, Folsom, CA) and a 0.32 mm x 100 m fused silica capillary column with a 50 % (mole fraction) octadecyl (C-18) methylpolysiloxane phase (0.1 µm film thickness) (CPSil 5 C18 CB, Chrompack International, Middelburg, The Netherlands). The results from the 5 % phenyl phase are designated as GC-ECD (IA) and the results from the C-18 phase are designated as GC-ECD (IB). A second set of samples was also analyzed by GC-ECD (i.e., GC-ECD IIA and IIB). Subsamples of 1 g to 2 g from three bottles of SRM 1944 and 2 g to 3 g subsamples from three bottles of SRM 1944 that had been mixed with a similar amount of water (i.e., a wetted sediment) were extracted, processed, and analyzed as described above for GC-ECD (I); however, the subsamples were extracted, processed and analyzed as part of three different sample sets at different times using different calibrations for each set.

Three sets of results were obtained by GC/MS. For GC/MS (I), 1 g to 2 g subsamples from six bottles were Soxhlet extracted with a mixture of 50 % hexane/50 % acetone. Copper powder was added to the extract to remove elemental sulfur. The concentrated extract was passed through a silica SPE cartridge and eluted with 10 % DCM in hexane. The extract was then analyzed by GC/MS using a 0.25 mm x 60 m fused silica capillary column with a 5 % phenyl-substituted methylpolysiloxane phase (0.25 µm film thickness). The GC/MS (II) results were obtained in the same manner as the GC/MS (I) analyses except that the six subsamples were extracted using PFE as described by Schantz et al. [10]. The GC/MS (III) analyses were performed on the same extract fractions analyzed in GC-ECD (II) using the 5 % phenyl-substituted methylpolysiloxane phase describe above for GC/MS (I). For both the GC-ECD and GC/MS analyses, two PCB congeners that are not significantly present in the sediment extract (PCB 103 and PCB 198 [14,15]), and 4,4'-DDT-d_8 were added to the sediment prior to extraction for use as internal standards for quantification purposes.

In addition to the analyses performed at NIST, SRM 1944 was used in an interlaboratory comparison exercise in 1995 as part of the NIST Intercomparison Exercise Program for Organic Contaminants in the Marine Environment [16]. Results from 19 laboratories that participated in this exercise were used as the eighth data set in the determination of the certified values for PCB congeners and chlorinated pesticides in SRM 1944. The laboratories participating in this exercise used the analytical procedures routinely used in their laboratories to measure PCB congeners and chlorinated pesticides.

Polychlorinated Dibenzo-*p*-dioxins and Dibenzofurans: Value assignment of the concentrations of the 17 2,3,7,8-substituted polychlorinated dibenzo-*p*-dioxin and dibenzofuran congeners and the total tetra- through hepta-substituted polychlorinated dibenzo-*p*-dioxins and dibenzofurans was accomplished by combining results from the analysis of SRM 1944 by 14 laboratories that participated in an interlaboratory comparison study (see Appendix A). Each laboratory analyzed three subsamples (typically 1 g) of SRM 1944 using their routine analytical procedures and gas chromatography with high resolution mass spectrometric detection (GC-HRMS).
The analytical procedures used by all of the laboratories included spiking with ^{13}C-labeled surrogates (internal standards); Soxhlet extraction with toluene; sample extract cleanup with acid/base silica, alumina, and carbon columns; and finally analysis of the cleaned up extract with GC-HRMS. Most of the laboratories used a 5 % phenyl-substituted methylpolysiloxane phase capillary column (DB-5), and about half of the laboratories confirmed 2,3,7,8-tetrachlorodibenzofuran using a 50 % (mole fraction) cyanopropylphenyl-substituted methylpolysiloxane capillary column (DB-225, J&W Scientific, Folsom, CA).

Analytical Approach for Inorganic Constituents: Value assignment for the concentrations of selected trace elements was accomplished by combining results of the analyses of SRM 1944 from NIST, NRCC, IAEA, and seven selected laboratories that participated in an interlaboratory comparison exercise coordinated by the NRCC [17] (see Appendix B). A similar approach was recently used to provide certified and reference concentration values for trace elements in two mussel tissue materials [18-20]. The analytical methods used for the determination of each element are summarized in Table 13. For the certified concentration values listed in Table 4, results were combined from: (1) analyses at NIST using isotope dilution inductively coupled plasma mass spectrometry (ID-ICPMS) or instrumental neutron activation analysis (INAA), (2) analyses at NRCC using ID-ICPMS, graphite furnace atomic absorption spectrometry (GFAAS), and/or inductively coupled plasma atomic emission spectroscopy (ICPAES), (3) analyses at IAEA using INAA, and (4) the mean of the results from seven selected laboratories that participated in the NRC interlaboratory comparison exercise. The reference concentration values in Table 7 were determined by combining results from (1) analyses performed at NIST using INAA; (2) analyses at NRCC using ID-ICPMS, GFAAS, ICPAES, and/or cold vapor atomic absorption spectroscopy (CVAAS); (3) analyses at IAEA using INAA; and (4) the mean of the results from five to seven laboratories that participated in the NRCC interlaboratory comparison exercise. The information concentration values in Table 12 were determined by INAA at NIST and IAEA.

NIST Analyses using ID-ICPMS: Lead, cadmium, and nickel were determined by ID-ICPMS [21]. Subsamples (0.4 g to 0.5 g) from six bottles of the SRM were spiked with ^{206}Pb, ^{111}Cd, and ^{62}Ni and wet ashed using a combination of nitric, hydrochloric, hydrofluoric, and perchloric acids. Lead and cadmium were determined in the same sample; nickel was determined in a second sample set. A small amount of crystalline material remained after the acid dissolution. Lithium metaborate fusion was performed on this residue to confirm that the residue contained insignificant amounts of the analytes. Cadmium and nickel were separated from the matrix material to eliminate the possibility of spectral interferences, and concentrations were determined from the measurement of the $^{112}Cd/^{111}Cd$ and $^{62}Ni/^{60}Ni$ ratios, respectively. The $^{208}Pb/^{206}Pb$ ratios were measured directly because interferences at these masses are negligible.

NIST Analyses using INAA: Analyses were performed in two steps [22]. Elements with short-lived irradiation products (Al, Ca, Cl, K, Mg, Mn, Na, Ti, and V) were determined by measuring duplicate 300 mg samples from each of 10 bottles of SRM 1944. The samples, standards, and controls were packaged in clean polyethylene bags and were individually irradiated for 15 s in the NIST Reactor Pneumatic Facility RT-4. Reactor power was 20 megawatts which corresponds to a neutron fluence rate of about 8×10^{13} $cm^{-2} \cdot s^{-1}$. After irradiation, the samples, controls, and standards were repackaged in clean polyethylene bags and counted (gamma-ray spectrometry) three times at different decay intervals. A sample to detector distance (counting geometry) of 20 cm was used. Elements with long-lived irradiation products (Ag, As, Br, Co, Cr, Cs, Fe, Rb, Sb, Sc, Se, Th, and Zn) were determined by measuring one 300 mg sample from each of nine bottles of SRM 1944. The samples, standards, controls, and blank polyethylene bags were irradiated together for a total of 1 h at a reactor power of 20 megawatts. Approximately four days after irradiation, the polyethylene bags were removed, and each sample, standard, control, and blank was counted at 20 cm from the detector. The samples were then recounted at 10 cm from another detector. After an additional decay time of about one month, the samples, standards, controls, and blanks were counted a third time (at 10 cm) from the second detector.

Particle-Size Information: Dry particle-size distribution measurements for SRM 1944 were obtained as part of a collaborative effort with Honeywell's Particle and Components Measurements Laboratory (Clearwater, FL). A Microtrac particle analyzer, which makes use of light-scattering techniques, was used to measure the particle-size distribution of SRM 1944. Briefly, a reference beam is used to penetrate a field of particles and the light that scatters in the forward direction from the field is measured and the particle size as a volume distribution is derived via a computer-assisted analysis. From these data, the total volume, average size, and a characteristic width of the particle-size distribution are calculated. The system has a working range from 0.7 μm to 700 μm.

Total Organic Carbon and Percent Extractable Mass: Four laboratories provided results for Total Organic Carbon (TOC) using similar procedures. Briefly, subsamples of approximately 200 mg were reacted with 6 N hydrochloric acid and rinsed with deionized water prior to combustion in a gas fusion furnace. The carbon monoxide and carbon dioxide produced were measured and compared to a blank for calculation of the percent TOC. Each laboratory analyzed subsamples from six bottles of SRM 1944. For the determination of percent extractable mass, six subsamples of approximately 1 g to 2 g of SRM 1944 were extracted using Soxhlet extraction for 18 h with DCM. The extraction thimbles were allowed to air dry. After reaching constant mass, the difference in the mass before and after extraction was determined.

Table 1. Certified Concentrations for Selected PAHs in SRM 1944

PAHs	Mass Fractions in mg/kg (dry-mass basis)[a,b]		
Naphthalene[c,d,e,f,g]	1.65	±	0.31
Phenanthrene[c,d,e,f,g]	5.27	±	0.22
Anthracene[c,d,e,f,g]	1.77	±	0.33
Fluoranthene[c,d,e,f,g]	8.92	±	0.32
Pyrene[c,d,e,f,g]	9.70	±	0.42
Benzo[*c*]phenathrene[c,d,e,f,h]	0.76	±	0.10
Benz[*a*]anthracene[c,d,e,f,g,h]	4.72	±	0.11
Chrysene[h,k]	4.86	±	0.10[i]
Triphenylene[h,k]	1.04	±	0.27
Benzo[*b*]fluoranthene[g,h,j]	3.87	±	0.42
Benzo[*j*]fluoranthene[h,j]	2.09	±	0.44
Benzo[*k*]fluoranthene[c,d,e,f,g,h,j]	2.30	±	0.20
Benzo[*a*]fluoranthene[c,d,e,f,h,j]	0.78	±	0.12
Benzo[*e*]pyrene[c,d,e,f,h,j]	3.28	±	0.11
Benzo[*a*]pyrene[c,d,e,f,g,h,j]	4.30	±	0.13
Perylene[c,d,e,f,g,h,j]	1.17	±	0.24
Benzo[*ghi*]perylene[c,d,e,f,j,k]	2.84	±	0.10
Indeno[1,2,3-*cd*]pyrene[c,d,e,f,j,k]	2.78	±	0.10
Dibenz[*a,j*]anthracene[c,d,e,f,j,k]	0.500	±	0.044
Dibenz[*a,c*]anthracene[j,k]	0.335	±	0.013
Dibenz[*a,h*]anthracene[j,k]	0.424	±	0.069
Pentaphene[c,d,e,f,j,k]	0.288	±	0.026
Benzo[*b*]chrysene[c,d,e,f,j,k,h]	0.63	±	0.10
Picene[c,d,e,f,j,k]	0.518	±	0.093

[a] Concentrations reported on dry-mass basis; material as received contains approximately 1.3 % moisture.

[b] The results are expressed as the certified value ± the expanded uncertainty. Each certified value is a mean of the means from two or more analytical methods, weighted as described in Paule and Mandel [23]. Each uncertainty, computed according to the CIPM approach as described in the ISO Guide [24], is an expanded uncertainty at the 95 % level of confidence, which includes random sources of uncertainty within each analytical method as well as uncertainty due to the drying study. The expanded uncertainty defines a range of values within which the true value is believed to lie, at a level of confidence of approximately 95 %.

[c] GC/MS (I) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with DCM.

[d] GC/MS (II) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with DCM.

[e] GC/MS (III) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with 50 % hexane/50 % acetone.

[f] GC/MS (IV) on 5 % phenyl-substituted methylpolysiloxane phase after PFE with 50 % hexane/50 % acetone.

[g] LC-FL of total PAH fraction after Soxhlet extraction with 50 % hexane/50 % acetone.

[h] GC/MS (Sm) using a smectic liquid crystalline phase after Soxhlet extraction with DCM.

[i] The uncertainty interval for chrysene was widened based on expert consideration of the analytical methods and analysis of the data for all PAHs, which suggests that the half-widths of the expanded uncertainties should not be less than 2 %.

[j] GC/MS (V) on 50 % phenyl-substituted methylpolysiloxane phase of extracts from GC/MS (III) and GC/MS (IV).

[k] LC-FL of isomeric PAH fractions after Soxhlet extraction with 50 % hexane/50 % acetone.

Table 2. Certified Concentrations for Selected PCB Congeners[a] in SRM 1944

PCB Congeners		Mass Fractions in µg/kg (dry-mass basis)[b,c]
PCB 8	(2,4'-Dichlorobiphenyl)[d,e,f,g,h,i,j,k]	22.3 ± 2.3
PCB 18	(2,2',5-Trichlorobiphenyl)[d,e,f,g,h,i,j,k]	51.0 ± 2.6
PCB 28	(2,4,4'-Trichlorobiphenyl)[d,e,f,g,j,k]	80.8 ± 2.7
PCB 31	(2,4',5-Trichlorobiphenyl)[d,e,f,g,j]	78.7 ± 1.6[l]
PCB 44	(2,2',3,5'-Tetrachlorobiphenyl)[d,e,f,g,h,i,j,k]	60.2 ± 2.0
PCB 49	(2,2',4,5'-Tetrachlorobiphenyl)[d,e,f,g,h,i,j,k]	53.0 ± 1.7
PCB 52	(2,2',5,5'-Tetrachlorobiphenyl)[d,e,f,g,h,i,j,k]	79.4 ± 2.0
PCB 66	(2,3',4,4'-Tetrachlorobiphenyl)[e,g,h,i,j]	71.9 ± 4.3
PCB 87	(2,2',3,4,5'-Pentachlorobiphenyl)[d,e,f,g,h,i,j]	29.9 ± 4.3
PCB 95	(2,2',3,5',6-Pentachlorobiphenyl)[e,g,h,i,j]	65.0 ± 8.9
PCB 99	(2,2',4,4',5-Pentachlorobiphenyl)[d,e,f,g,h,i,j,k]	37.5 ± 2.4
PCB 101	(2,2',4,5,5'-Pentachlorobiphenyl)[d,e,f,g,h,i,j,k]	73.4 ± 2.5
90	(2,2',3,4',5-Pentachlorobiphenyl)	
PCB 105	(2,3,3',4,4'-Pentachlorobiphenyl)[e,f,g,h,i,j,k]	24.5 ± 1.1
PCB 110	(2,3,3',4',6-Pentachlorobiphenyl)[g,h,i,j]	63.5 ± 4.7
PCB 118	(2,3',4,4',5-Pentachlorobiphenyl)[d,e,f,g,h,i,j,k]	58.0 ± 4.3
PCB 128	(2,2',3,3',4,4'-Hexachlorobiphenyl)[d,e,f,g,h,i,j,k]	8.47 ± 0.28
PCB 138	(2,2',3,4,4',5'-Hexachlorobiphenyl)[d,e,f,g,h,i,j,k]	62.1 ± 3.0
163	(2,3,3',4',5,6-Hexachlorobiphenyl)	
164	(2,3,3',4',5',6-Hexachlorobiphenyl)	
PCB 149	(2,2',3,4',5',6-Hexachlorobiphenyl)[d,e,f,g,h,i,j,k]	49.7 ± 1.2
PCB 151	(2,2',3,5,5',6-Hexachlorobiphenyl)[d,e,f,g,h,i,j,k]	16.93 ± 0.36
PCB 153	(2,2',4,4',5,5'-Hexachlorobiphenyl)[d,e,f,g,h,i,j,k]	74.0 ± 2.9
PCB 156	(2,3,3',4,4',5-Hexachlorobiphenyl)[d,e,f,g,h,i,j]	6.52 ± 0.66
PCB 170	(2,2',3,3',4,4',5-Heptachlorobiphenyl)[d,e,f,g,h,i,j,k]	22.6 ± 1.4
190	(2,3,3',4,4',5,5'-Heptachlorobiphenyl)	
PCB 180	(2,2',3,4,4',5,5'-Heptachlorobiphenyl)[d,e,f,g,h,i,j,k]	44.3 ± 1.2
PCB 183	(2,2',3,4,4',5',6-Heptachlorobiphenyl)[d,e,f,g,h,i,j]	12.19 ± 0.57
PCB 187	(2,2',3,4',5,5',6-Heptachlorobiphenyl)[d,e,f,g,h,i,j,k]	25.1 ± 1.0
159	(2,3,3',4,5,5'-Hexachlorobiphenyl)	
182	(2,2',3',4,4',5,6'-Heptachlorobiphenyl)	
PCB 194	(2,2',3,3',4,4',5,5'-Octachlorobiphenyl)[d,e,f,g,h,i,j]	11.2 ± 1.4
PCB 195	(2,2',3,3',4,4',5,6-Octachlorbiphenyl)[d,e,f,g,h,i,j,k]	3.75 ± 0.39
PCB 206	(2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl)[d,e,f,g,h,i,j,k]	9.21 ± 0.51
PCB 209	Decachlorobiphenyl [d,e,f,g,h,i,j,k]	6.81 ± 0.33

[a] PCB congeners are numbered according to the scheme proposed by Ballschmiter and Zell [14] and later revised by Schulte and Malisch [15] to conform with IUPAC rules; for the specific congeners mentioned in this SRM, the Ballschmiter-Zell numbers correspond to those of Schulte and Malisch. When two or more congeners are known to coelute under the conditions used, the congener listed first is the major component; additional congeners may be present as minor components.

[b] Concentrations reported on dry-mass basis; material as received contains approximately 1.3 % moisture.

[c] The results are expressed as the certified value ± the expanded uncertainty. Each certified value is a mean of the means from two or more analytical methods, weighted as described in Paule and Mandel [23]. Each uncertainty, computed according to the CIPM approach as described in the ISO Guide [24], is an expanded uncertainty at the 95 % level of confidence, which includes random sources of uncertainty within each analytical method as well as uncertainty due to the drying study. The expanded uncertainty defines a range of values within which the true value is believed to lie, at a level of confidence of approximately 95 %.

[d] GC-ECD (IA) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with DCM.

[e] GC-ECD (IB) on the 50 % C-18 dimethylpolysiloxane phase; same extracts analyzed as in GC-ECD (IA).

[f] GC-ECD (IIA) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with DCM.

[g] GC-ECD (IIB) on the 50 % octadecyl (C-18) methylpolysiloxane phase; same extracts analyzed as in GC-ECD (IIA).

[h] GC/MS (I) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with 50 % hexane/50 % acetone.

[i] GC/MS (II) on 5 % phenyl-substituted methylpolysiloxane phase after PFE extraction with 50 % hexane/50 % acetone.

[j] GC/MS (III) on 5 % phenyl-substituted methylpolysiloxane phase; same extracts analyzed as in GC-ECD (IIA).

[k] Results from 19 laboratories participating in an interlaboratory comparison exercise.

[l] The uncertainty interval for PCB 31 was widened based on expert consideration of the analytical methods and analysis of the data for all PCB congeners, which suggests that the half-widths of the expanded uncertainties should not be less than 2 %.

Table 3. Certified Concentrations for Selected Chlorinated Pesticides in SRM 1944

Chlorinated Pesticides	Mass Fractions in µg/kg (dry-mass basis)[a,b]
Hexachlorobenzene[e,f,g,h,i,j]	6.03 ± 0.35
cis-Chlordane (α-Chlordane)[c,d,e,f,g,h,i,j]	16.51 ± 0.83
trans-Nonachlor[c,d,e,f,g,h,i,j]	8.20 ± 0.51
4,4'-DDT[c,d,e,f,g,h,i,j]	119 ± 11

[a] Concentrations reported on dry-mass basis; material as received contains approximately 1.3 % moisture.
[b] The results are expressed as the certified value ± the expanded uncertainty. Each certified value is a mean of the means from two or more analytical methods, weighted as described in Paule and Mandel [23]. Each uncertainty, computed according to the CIPM approach as described in the ISO Guide [24], is an expanded uncertainty at the 95 % level of confidence, which includes random sources of uncertainty within each analytical method as well as uncertainty due to the drying study. The expanded uncertainty defines a range of values within which the true value is believed to lie, at a level of confidence of approximately 95 %.
[c] GC-ECD (IA) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with DCM.
[d] GC-ECD (IB) on the 50 % octadecyl (C-18) methylpolysiloxane phase; same extracts analyzed as in GC-ECD (IA).
[e] GC-ECD (IIA) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with DCM.
[f] GC-ECD (IIB) on the 50 % octadecyl (C-18) methylpolysiloxane phase; same extracts analyzed as in GC-ECD (IIA).
[g] GC/MS (I) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with 50 % hexane/50 % acetone.
[h] GC/MS (II) on 5 % phenyl-substituted methylpolysiloxane phase after PFE extraction with 50 % hexane/50 % acetone.
[i] GC/MS (III) on 5 % phenyl-substituted methylpolysiloxane phase; same extracts analyzed as in GC-ECD (IIA).
[j] Results from 19 laboratories participating in an interlaboratory comparison exercise.

Table 4. Certified Concentrations for Selected Inorganic Constituents in SRM 1944

Elements	Degrees of Freedom	Mass Fractions in percent (dry-mass basis)[a,b]
Aluminum[c,d,e]	4	5.33 ± 0.49
Iron[c,d,e]	6	3.53 ± 0.16
		Mass Fractions in mg/kg (dry-mass basis)[a,b]
Arsenic[c,d,e,f,g]	10	18.9 ± 2.8
Cadmium[e,f,h,i]	6	8.8 ± 1.4
Chromium[c,d,f,g,i]	9	266 ± 24
Lead[e,h,i]	5	330 ± 48
Manganese[c,d,e]	8	505 ± 25
Nickel[c,g,h,i]	6	76.1 ± 5.6
Zinc[c,d,e,g,i]	9	656 ± 75

[a] The results are expressed as the certified value ± the expanded uncertainty. The certified value is the mean of four results: (1) the mean of NIST INAA or ID-ICPMS analyses, (2) the mean of two methods performed at NRCC, and (3) the mean of results from seven selected laboratories participating in the NRCC intercomparison exercise, and (4) the mean results from INAA analyses at IAEA. The expanded uncertainty in the certified value is equal to $U = ku_c$, where u_c is the combined standard uncertainty and k is the coverage factor, both calculated according to the ISO Guide [24]. The value of u_c is intended to represent at the level of one standard deviation the combined effect of all the uncertainties in the certified value. Here u_c accounts for both possible method biases, within-method variation, and material inhomogeneity. The coverage factor, k, is the Student's t-value for a 95 % prediction interval with the corresponding degrees of freedom. Because of the material inhomogeneity, the variability among the measurements of multiple samples can be expected to be greater than that due to measurement variability alone.
[b] Concentrations reported on dry-mass basis; material as received contains approximately 1.3 % moisture.
[c] Results from five to seven laboratories participating in the NRCC interlaboratory comparison exercise.
[d] Measured at NIST using INAA.
[e] Measured at NRCC using ICPAES.
[f] Measured at NRCC using GFAAS.
[g] Measured at IAEA using INAA.
[h] Measured at NIST using ID-ICPMS.
[i] Measured at NRCC using ID-ICPMS.

Table 5. Reference Concentrations for Selected PAHs in SRM 1944

NOTE: These concentrations are provided as reference values because either the results have not been confirmed by an independent analytical technique as required for certification or the agreement among results from multiple methods was insufficient for certification. Although bias has not been evaluated for the procedures used, the reference values should be useful for comparison with results obtained using similar procedures.

PAHs	Mass Fractions in mg/kg (dry-mass basis)[a,b]		
1-Methylnaphthalene[c,d,e,f]	0.52	±	0.03
2-Methylnaphthalene[c,d,e,f]	0.95	±	0.05
Biphenyl[c,d,e,f]	0.32	±	0.07
Acenaphthene[c,d,e,f]	0.57	±	0.03
Fluorene[c,d,e,f]	0.85	±	0.03
Dibenzothiophene[d,e,f]	0.62	±	0.01[g]
1-Methylphenanthrene[c,d,e,f]	1.7	±	0.1
2-Methylphenanthrene[c,d,e,f]	1.90	±	0.06
3-Methylphenanthrene[c,d,e,f]	2.1	±	0.1
4-Methylphenanthrene and 9-Methylphenanthrene[c,d,e,f]	1.6	±	0.2
2-Methylanthracene[c,d,e,f]	0.58	±	0.04
3,5-Dimethylphenanthrene[c]	1.31	±	0.04
2,6-Dimethylphenanthrene[c]	0.79	±	0.02[g]
2,7-Dimethylphenanthrene[c]	0.67	±	0.02[g]
3,9-Dimethylphenanthrene[c]	2.42	±	0.05[g]
1,6-, 2,9-, and 2,5-Dimethylphenanthrene[c]	1.67	±	0.03[g]
1,7-Dimethylphenanthrene[c]	0.62	±	0.02[g]
1,9- and 4,9-Dimethylphenanthrene[c]	1.20	±	0.03[g]
1,8-Dimethylphenanthrene[c]	0.24	±	0.01[g]
1,2-Dimethylphenanthrene[c]	0.28	±	0.01[g]
8-Methylfluoranthene[c]	0.86	±	0.02[g]
7-Methylfluoranthene[c]	0.69	±	0.02
1-Methylfluoranthene[c]	0.66	±	0.02[g]
3-Methylfluoranthene[c]	2.46	±	0.07
2-Methylpyrene[c]	1.81	±	0.04[g]
4-Methylpyrene[c]	1.44	±	0.03[g]
1-Methylpyrene[c]	1.29	±	0.03
Anthanthrene[h]	0.9	±	0.1

[a] Concentrations reported on dry-mass basis; material as received contains approximately 1.3 % moisture.

[b] The reference value for each analyte is the equally-weighted mean of the means from two or more analytical methods or the mean from one analytical technique. The uncertainty in the reference value defines a range of values that is intended to function as an interval that contains the true value at a level of confidence of 95 %. This uncertainty includes sources of uncertainty within each analytical method, among methods, and from the drying study.

[c] GC/MS (I) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with DCM.

[d] GC/MS (II) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with DCM.

[e] GC/MS (III) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with 50 % hexane/50 % acetone.

[f] GC/MS (IV) on 5 % phenyl-substituted methylpolysiloxane phase after PFE with 50 % hexane/50 % acetone.

[g] The uncertainty interval for this compound was widened in accordance with expert consideration of the analytical procedures, along with the analysis of the data as a whole, which suggests that the half-widths of the expanded uncertainties should not be less than 2 %.

[h] LC-FL of isomeric PAH fractions after Soxhlet extraction with 50 % hexane/50 % acetone.

Table 6. Reference Concentrations for Selected Chlorinated Pesticides in SRM 1944

NOTE: These concentrations are provided as reference values because either the results have not been confirmed by an independent analytical technique as required for certification or the agreement among results from multiple methods was insufficient for certification. Although bias has not been evaluated for the procedures used, the reference values should be useful for comparison with results obtained using similar procedures.

Chlorinated Pesticides	Mass Fractions in µg/kg (dry-mass basis)[a,b]
α-HCH[c,d,e,f]	2.0 ± 0.3
trans-Chlordane (γ-Chlordane)[c,d,e,f,g,h,i,j]	8 ± 2
cis-Nonachlor [d,e,f,i,j]	3.7 ± 0.7
2,4'-DDE [c,d,e,f,g,h,i,j]	19 ± 3
2,4'-DDD [e,f,g,h,i,j]	38 ± 8
4,4'-DDE [c,d,e,f,g,h,i,j]	86 ± 12
4,4'-DDD [c,d,e,f,g,h,i,j]	108 ± 16

[a] Concentrations reported on dry-mass basis; material as received contains approximately 1.3 % moisture.
[b] The reference value for each analyte is the equally-weighted mean of the means from two or more analytical methods or the mean from one analytical technique. The uncertainty in the reference value defines a range of values that is intended to function as an interval that contains the true value at a level of confidence of 95 %. This uncertainty includes sources of uncertainty within each analytical method, among methods, and from the drying study.
[c] GC-ECD (IA) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with DCM.
[d] GC-ECD (IB) on the 50 % octadecyl (C-18) methylpolysiloxane phase; same extracts analyzed as in GC-ECD (IA).
[e] GC-ECD (IIA) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with DCM.
[f] GC-ECD (IIB) on the 50 % octadecyl (C-18) methylpolysiloxane phase; same extracts analyzed as in GC-ECD (IIA).
[g] GC/MS (I) on 5 % phenyl-substituted methylpolysiloxane phase after Soxhlet extraction with 50 % hexane/50 % acetone.
[h] GC/MS (II) on 5 % phenyl-substituted methylpolysiloxane phase after PFE extraction with 50 % hexane/50 % acetone.
[i] GC/MS (III) on 5 % phenyl-substituted methylpolysiloxane phase; same extracts anlayzed as in GC-ECD (IIA).
[j] Results from 19 laboratories participating in an interlaboratory comparison exercise.

Table 7. Reference Concentrations for Selected Inorganic Constituents in SRM 1944 as Determined by Multiple Laboratories

NOTE: These concentrations are provided as reference values because either the results have not been confirmed by an independent analytical technique as required for certification, the agreement among results from multiple methods was insufficient for certification, or insufficient analyses have been performed at NIST to confirm the results of the outside laboratories.

Elements	Degrees of Freedom	Mass Fraction in percent (dry-mass basis)[a,b]
Silicon[c,d]	81	31 ± 3
		Mass Fraction in mg/kg (dry-mass basis)[a,b]
Beryllium[c,h]	17	1.6 ± 0.3
Copper[c,d,f]	101	380 ± 40
Mercury[c,i]	18	3.4 ± 0.5
Selenium[c,e,f]	24	1.4 ± 0.2
Silver[c,d,e,g]	8	6.4 ± 1.7
Thallium[c,f]	12	0.59 ± 0.1
Tin[c,f]	22	42 ± 6

[a] The results are expressed as the reference value ± the expanded uncertainty. The reference value is the equally weighted mean of available results from: (1) NIST INAA analyses, (2) two methods performed at NRCC, (3) results from seven selected laboratories participating in the NRCC intercomparison exercise, and (4) results from INAA analyses at IAEA. The expanded uncertainty in the reference value is equal to $U = ku_c$ where u_c is the combined standard uncertainty and k is the coverage factor, both calculated according to the ISO Guide [24]. The value of u_c is intended to represent at the level of one standard deviation, the uncertainty in the value. Here u_c accounts for both possible method differences, within-method variation, and material inhomogeneity. The coverage factor, k, is the Student's t-value for a 95 % prediction interval with the corresponding degrees of freedom. Because of material inhomogeneity, the variability among the measurements of multiple samples can be expected to be greater than that due to measurement variability alone.

[b] Concentrations reported on dry-mass basis; material as received contains approximately 1.3 % moisture.
[c] Results from five to seven laboratories participating in the NRCC interlaboratory comparison exercise.
[d] Measured at NRCC using GFAAS.
[e] Measured at NIST using INAA.
[f] Measured at NRCC using ID-ICPMS.
[g] Measured at IAEA using INAA.
[h] Measured at NRCC using ICPAES.
[i] Measured at NRCC using CVAAS.

Table 8. Reference Concentrations for Selected Inorganic Constituents in SRM 1944 as Determined by INAA

NOTE: These concentrations are provided as reference values because the results have not been confirmed by an independent analytical technique as required for certification; therefore, unrecognized bias may exist for some analytes in this matrix.

Element	Effective Degrees of Freedom	Mass Fraction in percent (dry-mass basis)[a,b]		
Calcium	21	1.0	±	0.1
Chlorine	21	1.4	±	0.2
Potassium	21	1.6	±	0.2
Sodium	25	1.9	±	0.1
		Mass Fraction in mg/kg (dry-mass basis)[a,b]		
Bromine	10	86	±	10
Cesium	11	3.0	±	0.3
Cobalt	10	14	±	2
Rubidium	14	75	±	2
Scandium	37	10.2	±	0.2
Titanium	21	4300	±	300
Vanadium	21	100	±	9

[a] The results are expressed as the reference value ± the expanded uncertainty. The reference value is based on the results from an INAA study. The associated uncertainty accounts for both random and systematic effects, but because only one method was used, unrecognized bias may exist for some analytes in this matrix. The expanded uncertainty in the reference value is equal to $U = ku_c$, where u_c is the combined standard uncertainty and k is the coverage factor, both calculated according to the ISO Guide [24]. The value of u_c is intended to represent at the level of one standard deviation, the uncertainty in the value. Here u_c accounts for within-method variation and material inhomogeneity. The coverage factor, k, is the Student's t-value for a 95 % prediction interval with the corresponding degrees of freedom. Because of material inhomogeneity, the variability among the measurements of multiple samples can be expected to be greater than that due to measurement variability alone.
[b] Concentrations reported on dry-mass basis; material as received contains approximately 1.3 % moisture.

Table 9. Reference Concentrations for Selected Dibenzo-*p*-dioxin and Dibenzofuran Congeners in SRM 1944

NOTE: These concentrations are provided as reference values because the results have not been confirmed by an independent analytical technique as required for certification. Although bias has not been evaluated for the procedures used, the reference values should be useful for comparison with results obtained using similar procedures.

Dibenzo-*p*-dioxin and Dibenzofuran Congeners	Mass Fraction in µg/kg (dry-mass basis)[a,b]		
2,3,7,8-Tetrachlorodibenzo-*p*-dioxin	0.133	±	0.009
1,2,3,7,8-Pentachlorodibenzo-*p*-dioxin	0.019	±	0.002
1,2,3,4,7,8-Hexachlorodibenzo-*p*-dioxin	0.026	±	0.003
1,2,3,6,7,8-Hexachlorodibenzo-*p*-dioxin	0.056	±	0.006
1,2,3,7,8,9-Hexachlorodibenzo-*p*-dioxin	0.053	±	0.007
1,2,3,4,6,7,8-Heptachlorodibenzo-*p*-dioxin	0.80	±	0.07
Octachlorodibenzo-*p*-dioxin	5.8	±	0.7
2,3,7,8-Tetrachlorodibenzofuran[c]	0.039	±	0.015[d]
1,2,3,7,8-Pentachlorodibenzofuran	0.045	±	0.007
2,3,4,7,8-Pentachlorodibenzofuran	0.045	±	0.004
1,2,3,4,7,8-Hexachlorodibenzofuran	0.22	±	0.03
1,2,3,6,7,8-Hexachlorodibenzofuran	0.09	±	0.01
2,3,4,6,7,8-Hexachlorodibenzofuran	0.054	±	0.006[e]
1,2,3,7,8,9-Hexachlorodibenzofuran	0.019	±	0.018[f]
1,2,3,4,6,7,8-Heptachlorodibenzofuran	1.0	±	0.1
1,2,3,4,7,8,9-Heptachlorodibenzofuran	0.040	±	0.006[e]
Octachlorodibenzofuran	1.0	±	0.1
Total Toxic Equivalents (TEQ)[g]	0.25	±	0.01
Total Tetrachlorodibenzo-*p*-dioxins	0.25	±	0.05[e]
Total Pentachlorodibenzo-*p*-dioxins	0.19	±	0.06
Total Hexachlorodibenzo-*p*-dioxins	0.63	±	0.09
Total Heptachlorodibenzo-*p*-dioxins	1.8	±	0.2
Total Tetrachlorodibenzofurans	0.7	±	0.2
Total Pentachlorodibenzofurans	0.74	±	0.07
Total Hexachlorodibenzofurans	1.0	±	0.1
Total Heptachlorodibenzofurans	1.5	±	0.1
Total Dibenzo-*p*-dioxins[h]	8.7	±	0.9
Total Dibenzofurans[h]	5.0	±	0.5

[a] Each reference value is the mean of the results from up to 14 laboratories participating in an interlaboratory exercise. The expanded uncertainty in the reference value is equal to $U = ku_c$, where u_c is the combined standard uncertainty calculated according to the ISO Guide [24] and k is the coverage factor. The value of u_c is intended to represent at the level of one standard deviation, the combined effect of all the uncertainties in the reference value. Here u_c is the uncertainty in the mean arising from the variation among the laboratory results. The degrees of freedom is equal to the number of available results minus one (13 unless noted otherwise). The coverage factor, k, is the value from a student's t-distribution for a 95 % confidence interval.

[b] Concentrations reported on dry-mass basis; material as received contains approximately 1.3 % moisture.

[c] Confirmation results using a 50 % cyanopropyl phenyl polysiloxane or 90 % *bis*-cyanopropyl 10 % cyanopropylphenyl polysiloxane phase columns.

[d] Degrees of freedom = 7 for this compound.

[e] Degrees of freedom = 12 for this compound.

[f] Degrees of freedom = 9 for this compound.

[g] TEQ is the sum of the products of each of the 2,3,7,8-substituted congeners multiplied by their individual toxic equivalency factors (TEFs) recommended by the North Atlantic Treaty Organization (NATO) [25]. With regard to 2,3,7,8-tetrachlorodibenzofuran, the results of the confirmation column were used when available to calculate the TEQ.

[h] Total of tetra- through octachlorinated congeners.

Table 10. Reference Values for Particle-Size Characteristics for SRM 1944

NOTE: These results are provided as reference values because the results are method specific as defined by the procedures described in the Preparation and Analysis section. Although bias has not been evaluated for the procedures used, the reference values should be useful for comparison with results obtained using similar procedures.

Particle Measurement	Value[a]
Mean diameter (volume distribution, MV, μm)[b]	151.2 ± 0.4
Mean diameter (area distribution, μm)[c]	120.4 ± 0.1
Mean diameter (number distribution, μm)[d]	75.7 ± 0.3
Surface Area (m^2/cm^3)[e]	0.050 ± 0.013

[a] The reference value is the mean value of measurements from the analysis of subsamples from four bottles. Each uncertainty, computed according to the CIPM approach as described in the ISO Guide [24], is an expanded uncertainty at the 95 % level of confidence, which includes random sources of uncertainty. The expanded uncertainty defines a range of values for the reference value within which the true value is believed to lie, at a level of confidence of 95 %.

[b] The mean diameter of the volume distribution represents the center of gravity of the distribution and compensates for scattering efficiency and refractive index. This parameter is strongly influenced by coarse particles.

[c] The mean diameter of the area distribution, calculated from the volume distribution with less weighting by the presence of coarse particles than MV.

[d] The mean diameter of the number distribution, calculated using the volume distribution weighted to small particles.

[e] Calculated specific surface area assuming solid, spherical particles. This is a computation and should not be interchanged with an adsorption method of surface area determination as this value does not reflect porosity or topographical characteristics.

The following data show the percent of the volume that is smaller than the indicated size:

Percentile	Particle Diameter (μm)[a]
95	296 ± 5
90	247 ± 2
80	201 ± 1
70	174 ± 1
60	152 ± 1
50[b]	135 ± 1
40	120 ± 1
30	106 ± 1
20	91 ± 1
10	74 ± 1

[a] The reference value for particle diameter is the mean value of measurements from the analysis of subsamples from four bottles. Each uncertainty, computed according to the CIPM approach as described in the ISO Guide [24], is an expanded uncertainty at the 95 % level of confidence, which includes random sources of uncertainty. The expanded uncertainty defines a range of values for the reference value within which the true value is believed to lie, at a level of confidence of 95 %.

[b] Median diameter (50 % of the volume is less than 135 μm).

Table 11. Reference Values for Total Organic Carbon and Percent Extractable Mass in SRM 1944

NOTE: These results are provided as reference values because the results are method specific as defined by the procedures described in the Preparation and Analysis section. Although bias has not been evaluated for the procedures used, the reference values should be useful for comparison with results obtained using similar procedures.

Total Organic Carbon (TOC)	4.4 % ± 0.3 % mass fraction[a,b]
Extractable Mass[c]	1.15 % ± 0.04 % mass fraction[a,d]

[a] Concentration is reported on a dry-mass basis; material as received contains approximately 1.3% moisture.
[b] The reference value for total organic carbon is an equally weighted mean value from routine measurements made by three laboratories. Each uncertainty, computed according to the CIPM approach as described in the ISO Guide [24], is an expanded uncertainty at the 95 % level of confidence, which includes random sources of uncertainty. The expanded uncertainty defines a range of values for the reference value within which the true value is believed to lie, at a level of confidence of 95 %.
[c] Extractable mass as determined from Soxhlet extraction using DCM.
[d] The reference value for extractable mass is the mean value of six measurements. Each uncertainty, computed according to the CIPM approach as described in the ISO Guide [24], is an expanded uncertainty at the 95 % level of confidence, which includes random sources of uncertainty. The expanded uncertainty defines a range of values for the reference value within which the true value is believed to lie, at a level of confidence of 95 %.

Table 12. Information Values for Concentrations for Selected Inorganic Constituents in SRM 1944 as Determined by INAA

NOTE: These results are provided as information values only because insufficient information is available to assess adequately the uncertainty associated with the value or only a limited number of analyses were performed.

Elements	Mass Fractions in percent (dry-mass basis)[a]
Magnesium[b]	1.0
	Mass Fractions in mg/kg (dry-mass basis)[a]
Antimony[b,c]	5
Cerium[c]	65
Europium[c]	1.3
Gold[c]	0.10
Lanthanum[c]	39
Thorium[c]	13
Uranium[c]	3.1

[a] Concentration is reported on a dry-mass basis; material as received contains approximately 1.3 % moisture.
[b] Measured at NIST using INAA.
[c] Measured at IAEA using INAA.

Table 13. Analytical Methods Used for the Analysis of SRM 1944 for Inorganic Constituents

Elements	Analytical Methods
Aluminum	FAAS, ICPAES, INAA, XRF
Antimony	GFAAS, HGAAS, ICP-MS, ID-ICPMS, INAA
Arsenic	GFAAS, HGAAS, ICPMS, INAA, XRF
Beryllium	GFAAS, ICP-AES, ICPMS
Bromine	INAA
Cadmium	FAAS, GFAAS, ICPMS, ID-ICPMS
Calcium	INAA
Cerium	INAA
Cesium	INAA
Chlorine	INAA
Chromium	FAAS, GFAAS, ICPMS, ID-ICPMS, INAA, XRF
Cobalt	INAA
Copper	FAAS, GFAAS, ICPAES, ICPMS, ID-ICPMS, XRF
Europium	INAA
Gold	INAA
Iron	FAAS, ICPAES, ICPMS, ID-ICPMS, INAA, XRF
Lanthanum	INAA
Lead	FAAS, GFAAS, ICPMS, ID-ICPMS, XRF
Magnesium	INAA
Manganese	FAAS, ICPAES, ICPMS, INAA, XRF
Mercury	CVAAS, ICPMS
Nickel	GFAAS, ICPAES, ICPMS, ID-ICPMS, INAA, XRF
Potassium	INAA
Rubidium	INAA
Scandium	INAA
Selenium	GFAAS, HGAAS, ICPMS, INAA
Silicon	FAAS, ICPAES, XRF
Silver	FAAS, GFAAS, ICPMS, INAA
Sodium	INAA
Thallium	GFAAS, ICPAES, ICPMS, ID-ICPMS
Thorium	INAA
Tin	GFAAS, ICPMS, ID-ICPMS
Titanium	INAA
Uranium	INAA
Vanadium	INAA
Zinc	FAAS, ICPAES, ICPMS, ID-ICPMS, XRF, INAA

Methods	
CVAAS	Cold vapor atomic absorption spectrometry
FAAS	Flame atomic absorption spectrometry
GFAAS	Graphite furnace atomic absorption spectrometry
HGAAS	Hydride generation atomic absorption spectrometry
ICPAES	Inductively coupled plasma atomic emission spectrometry
ICPMS	Inductively coupled plasma mass spectrometry
ID-ICPMS	Isotope dilution inductively coupled plasma mass spectrometry
INAA	Instrumental neutron activation analysis
XRF	X-ray fluorescence spectrometry

APPENDIX A

The analysts and laboratories listed below participated in the interlaboratory comparison exercise for the determination of polychlorinated dibenzo-*p*-dioxins and dibenzofurans in SRM 1944.

W.J. Luksemburg, Alta Analytical Laboratory, Inc., El Dorado Hills, CA
L. Phillips, Axys Analytical Services Ltd., Sidney, British Columbia, Canada
M.J. Armbruster, Battelle Columbus Laboratories, Columbus, OH
G. Reuel, Canviro Analytical Laboratories Ltd., Waterloo, Ontario, Canada
C. Brochu, Environment Québec, Laval, Québec, Canada
G. Poole, Environment Canada Environmental Technology Centre, Ottawa, Ontario, Canada
B. Henkelmann, GSF National Research Center for Environment and Health, Neuherberg, Germany
R. Anderson, Institute of Environmental Chemistry, Umeå University, Umeå, Sweden
C. Lastoria, Maxxam Analytics, Inc., Mississauga, Ontario, Canada
E. Reiner, Ontario Ministry of Environment and Energy, Etobicoke, Ontario, Canada
J. Macaulay, Research and Productivity Council, Fredericton, New Brunswick, Canada
T.L. Wade, GERG, Texas A&M University, College Station, TX
C. Tashiro, Wellington Laboratories, Guelph, Ontario, Canada
T.O. Tiernan, Wright State University, Dayton, OH

APPENDIX B

The analysts and laboratories listed below participated in the interlaboratory comparison exercise for the determination of trace elements in SRM 1944.

A. Abbgy, Applied Marine Research Laboratory, Old Dominion University, Norfolk, VA
A. Scott, Australian Government Analytical Laboratories, Pymble, Australia
H. Mawhinney, Animal Research Institute, Queensland Department of Primary Industries, Queensland, Australia
E. Crecelius, Battelle Pacific Northwest, Sequim, WA
M. Stephenson, California Department of Fish and Game, Moss Landing, CA
B. Presley, Department of Oceanography, Texas A&M University, College Station, TX
K. Elrick, U.S. Geological Survey, Atlanta, GA

Memo

To: Bill Sy, USEPA Region II
Elizabeth Butler, USEPA Region II

Cc: Paul Bluestein, Tierra Solutions, Inc.

From: Diane Waldschmidt, Environmental Data Services, Ltd.

Date: July 25, 2007

Subject: SRM 2007

Tierra has agreed to expand the performance evaluation (PE) sample program planned as a pre-mobilization task to be completed prior to sample collection activities associated with the Newark Bay Study Area Phase II RIWP. The PE program will be expanded to include representative congener PCBs, chlorinated pesticides, semi-volatile fraction organic compounds including polycyclic aromatic hydrocarbons, and metals in addition to the previously planned dioxin and furan PE constituents. This memorandum provides a description of the proposed PE quality assurance program and provides clarification of the following:

1. How PE samples will be submitted to the laboratories for analysis.
2. How PE sample analytical results will be evaluated.
3. What utility the PE evaluations will serve the project.

Analyses of solid PE samples containing certified concentrations of the constituents described above will be a pre-mobilization work element. As such, they will be submitted blind to the laboratory prior to initiation of sample collection activities. PE samples will be comprised of standard reference materials (SRMs) and/or certified reference materials (CRMs) (depending on availability of such materials) for a given constituent. PEs will represent a solid sample matrix, either sediment or soil, and will be purchased through commercial vendors. Potential vendors for SRMs/CRMs have been identified in Table 1. Details related to SRMs/CRMs selected for initial submission to project contract laboratories are provided in Tables 2 through 7. Please note that in most cases performance acceptance limits are derived based on inter-laboratory round robin

E-MAIL • edatas@aol.com

studies. Acceptance ranges have been developed based on the 95% confidence interval applied as the range around the mean value produced for each constituent, using the analytical methods to be used in this study. The one exception is the SRM for Congener PCBs (NIST 1944), selected by the United States Environmental Protection Agency (USEPA) Region II for use in this program. Alternate vendors to those listed as primary in Table 1 will be utilized on an as needed basis in situations where non-conformances are identified after primary SRM/CRM results are evaluated.

Please note that although CRMs have been identified for semivolatile, chlorinated pesticides and metals constituents, certified reference values are provided by the vendor on a lot specific basis. Therefore, EDS cannot provide this specific information at this time.

Analytes contained in a given PE at certified concentrations must be positively identified and quantitated by the laboratory at concentrations within the certified acceptance range as explained in the attached tables. Successful analysis of PE samples is a pre-mobilization requirement. Therefore, non-conforming results will be specifically addressed by way of non-conformance memo, corrective action and a follow-up demonstration of acceptable results obtained upon submission of a second alternate blind PE identified in Table 1. When conforming results are obtained or once non-conforming results are addressed as described above, project tasks related to analyses for these constituents will commence.

The pre-mobilization submission and successful analysis of the above described analyte-specific PE samples will provide documentation of the laboratory's ability to proficiently analyze NBRIWP Phase II samples during the field effort. A report will be prepared at the conclusion of the PE quality assurance program. This report will contain a comparison of analytical results reported for certified constituents by the contract laboratory, the established acceptance ranges for each certified target constituent, and an indication of the laboratory's performance (i.e., success or failure) as explained in the attached tables. Copies of the SRM/CRM vendor certificates of analysis will also be included in the final report.

(1.) NIST - National Institute of Standards and Technology.
(2.) Reference values for the NIST 1944 SRM will be based on the following criteria set by USEPA Region II for use on the Newark Bay Study Area Phase II RIWP.
- Acceptance ranges will be +/- 30% of the assigned value listed in the table above.
- Up to three of the eighteen Congener PCBs listed above may have laboratory results fall outside the established acceptance range during implementation of this PE program so long as no individual result reported exceeds a limit of +/- 50% of its assigned value.
