Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Notes:
J - Estimated Concentration
R - Rejected data
U - The analyte was analyzed for, but was not detected above the reported sample detection limit.
(a) - Sum of detected and non-detected congeners. All values were as originally reported.
(b) - Kaplan-Meier Total Equivalent Concentration calculated using EPA's KM TEQ Calculator.

Attachment A-1

DATA USABILITY WORKSHEET
Site: Newark Bay Study Area
Medium: Sediment, Blue Crab and Softshell Clam Tissue Chemistry

Activity	Comment
Field Sampling	
Discuss sampling problems and field conditions that affect data usability.	Sediment, clam tissue and crab tissue were collected during the 2014 Clam and Crab Sampling Program as described in the approved QAPP (Tierra 2014), the field collection report (Normandeau 2017), and the data usability report (GSH 2017). Sampling problems and field conditions did not significantly affect data usability for the Crab/Clam program.
Are samples representative of receptor exposure for this medium (e.g. sample depth, grab vs composite, filtered vs unfiltered, low flow, etc.)?	Samples were representative of receptor exposure for each medium in accordance with the EPA approved QAPP (Tierra 2014). Composite crab samples were selected to be representative of each geographic zone identified and approved by EPA. Tissue compositing was conducted in accordance with the EPA-approved Crab Composite Plan and SOP No. 13 – Laboratory Tissue Homogenization of the Crab and Clam QAPP (Tierra 2014). Crab samples were also collected from 12 Intertidal Areas. Softshell clams were collected from 18 Intertidal Areas throughout the NBSA. Sediment was collected from each Intertidal Area location for chemical analysis.
Assess the effect of field QC results on data usability.	During data validation activities, analytical data were evaluated in accordance with requirements of the QAPP (Tierra 2014). In addition, data validation qualifiers were consistently applied to the analytical data generated during the crab and clam program.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	Field sampling issues did not affect usability for risk assessment.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	Definitive analytical methods were selected in the EPA approved QAPP based on DUOs and DQOs, including risk assessment. See Worksheets #11 of the QAPP (Tierra 2014).

Were detection limits adequate?	Detection limits generally achieved the risk-based screening levels or Project Action Levels or were the best available using EPA approved analytical methods. See Worksheet #15-1 through #15-3 of the QAPP (Tierra 2014).
Summarize the effect of analytical technique issues on the risk assessment, if applicable.	All methods provided usable results for risk assessment.
Data Quality Objectives	
Precision - How were duplicates handled?	Field duplicates were only applicable to sediment samples. Due to limited clam and crab tissue mass, only laboratory replicates were collected for these tissue matrices. Acceptance criteria for field and laboratory duplicates are provided in Worksheets #12-2 and #12-3 of the QAPP (Tierra 2014). Conformance to laboratory duplicate frequency requirements, as well as acceptability of the resulting RPD values, were evaluated and considered during data validation. There are no limitations on data usage based on precision quality acceptance criteria (GSH 2017).

Activity	**Comment**
Data Quality Objectives (continued)	
Accuracy - How were split samples handled?	Measurement performance criteria for accuracy/bias contamination are outlined in Worksheets #12-1 through #12-3 of the QAPP (Tierra 2014). Acceptability of quality control (QC) results for accuracy/bias contamination and conformance to field and laboratory QC sample frequency requirements were evaluated and considered during the data verification/validation. There are no limitations on the data usage based on accuracy/bias contamination acceptance criteria (GSH 2017).
Representativeness - Indicate any problems associated with data representativeness (e.g., trip blank or rinsate blank contamination, chain of custody problems, etc.).	Representativeness is the degree to which a dataset accurately represents the characteristics of a population, parameter conditions at a sample point, or an environmental condition. Data are representative when all sampling and analyses are performed in compliance with appropriate procedures. Performing sample analyses within the specified holding times and adhering to sample handling and storage requirements are also critical elements in obtaining representative sample data. These elements were evaluated and considered during data verification/validation. Acceptance criteria for sample handling, storage and holding times are provided in Worksheets #19-3 through #19-7 of the QAPP (Tierra 2014). There are no limitations on the data usage based on representativeness acceptance criteria (GSH 2017).

DATA USABILITY WORKSHEET
Site: Newark Bay Study Area
Medium: Sediment, Blue Crab and Softshell Clam Tissue Chemistry

Completeness - Indicate any problems associated with data completeness (e.g., incorrect sample analysis, incomplete sample records, problems with field procedures, etc.).	The targeted field and analytical completeness goals were 90% for the crab and clam program; these goals were met or exceeded. The analytical completeness achieved for total crab tissue was 97.5%. The analytical completeness achieved for total clam tissue was 99.1%. The analytical completeness for total sediment was. 99.8%. The total analytical completeness for all matrices analyzed is 98%.
Comparability - Indicate any problems associated with data comparability.	Comparability was achieved by using the same EPA approved methods and same laboratories. With respect to the results of the crab and clam program data, there were no limitations on the data usage based on comparability acceptance criteria. Comparability expresses the confidence with which one set of data can be compared to another to measure the same property. Data can be compared to the degree that their accuracy, precision, and representativeness are known and documented. Data are comparable if QC measures such as collection techniques, measurement procedures, analytical methods, and reporting units are equivalent for the samples within a sample set. Data subject to established quality assurance/quality control (QA/QC) measures are deemed more reliable and, therefore, more comparable, than data generated without such measures. Consistent application of prescribed procedures was monitored throughout the crab and clam program. Likewise, specific data verification/validation protocols were consistently applied to all data generated under this program to understand and document accuracy/bias, accuracy/bias contamination, precision, sensitivity and representativeness, thereby establishing comparability. During data validation activities, analytical data were evaluated using a defined set of guidelines and acceptance criteria. In addition, data validation qualifiers were consistently applied to the analytical data generated during the crab and clam program. The data validation process serves to increase the degree of data comparability achieved. There are no limitations on the data usage based on comparability acceptance criteria (GSH 2017).
Were the DQOs specified in the QAPP satisfied?	Yes
Summarize the effect of DQO issues on the risk assessment, if applicable.	None
Data Validation and Interpretation	
What are the data validation requirements?	Data validation requirements were defined in Appendix N of the QAPP (Tierra 2014).

DATA USABILITY WORKSHEET
Site: Newark Bay Study Area
Medium: Sediment, Blue Crab and Softshell Clam Tissue Chemistry

What method or guidance was used to validate the data?	Data validation guidance and processes were included in Appendix N and Worksheets #34 and #35 of the QAPP (Tierra 2014).

Activity	Comment
Data Validation and Interpretation (continued)	
Was the data validation method consistent with guidance? Discuss any discrepancies.	Yes
Were all data qualifiers defined? Discuss those which were not.	Yes, all validation based data qualifiers were defined in the data validation reports provided in the appendices in the associated data report.
Which qualifiers represent useable data?	All qualifiers except 'R' represent usable data.
Which qualifiers represent unusable data?	The rejected (R flagged) results were not considered usable per cited validation guidance and EPA directives.
How are tentatively identified compounds (TICs) handled?	TICs were not quantitatively evaluated in the risk assessment.
Summarize the effect of data validation and interpretation issues on the risk assessment, if applicable.	There is no impact to risk assessment due to data usability.
Additional notes:	Split sample analysis conducted by EPA resulted in a finding of comparability for all media except sediment (Berger 2017a). It was concluded that there was analytical bias for PAHs and PCBs in sediment samples when compared to results from the EPA laboratory (Louis Berger 2017b). All Crab/Clam sediment samples were reanalyzed for PAHs and PCBs. With the exception of holding times, all procedures were conducted according to the approved QAPP. There are no limitations on usability of the reanalyzed data.

Note: The purpose of this Worksheet is to succinctly summarize the data usability analysis and conclusions. Reference specific pages in the Remedial Investigation and/or the Risk Assessment text to further expand on the information presented here.

DATA USABILITY WORKSHEET
Site: Newark Bay Study Area
Medium: Fish Tissue

Activity	Comment
Field Sampling	
Discuss sampling problems and field conditions that affect data usability.	Fish sampling was conducted in accordance with the approved QAPP (Tierra 2014a) the field collection report (Normandeau 2017), and the data usability report (GSH 2017). Sampling problems and field conditions did not affect data usability for fish sampling program.
Are samples representative of receptor exposure for this medium (e.g. sample depth, grab vs composite, filtered vs unfiltered, low flow, etc.)?	Samples were representative of receptor exposure for each medium in accordance with the EPA approved QAPP (Tierra 2014a). Fish were collected from various locations along the subtidal flats, transitional slopes, and navigational channel throughout each of the three geographic zones (north, central, south) in the NBSA. Fish were collected from each of the different geographic areas to provide spatial coverage across the entire NBSA. Additionally, 12 intertidal areas were targeted for up to 19 forage fish samples (mummichog, striped killifish, Atlantic menhaden, or bay anchovy). These areas are consistent with those selected for clam and sediment sampling (Tierra 2014b). Forage fish were targeted at 16 sampling locations and three supplemental sampling locations (Intertidal Areas 124, 125, and 126).
Assess the effect of field QC results on data usability.	During data validation activities, analytical data were evaluated in accordance with the verification/validation protocols specified in Worksheet #34 and Worksheet #35 of the QAPP (Tierra 2014a). In addition, data validation qualifiers were consistently applied to the analytical data generated during the fish program.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	Field sampling issues did not affect usability for risk assessment.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	Definitive analytical methods were selected in the EPA approved QAPP based on DUOs and DQOs, including risk assessment. See Worksheets #11 of the QAPP (Tierra, 2014a).

Were detection limits adequate?	Detection limits generally achieved the risk-based screening levels or Project Action Levels or were the best available using EPA approved analytical methods. See Worksheet #15-1 through #15-2 of the QAPP (Tierra, 2014a).
Summarize the effect of analytical technique issues on the risk assessment, if applicable.	All methods provided usable results for risk assessment.
Data Quality Objectives	
Precision - How were duplicates handled?	Acceptance criteria for field and laboratory duplicates are provided in Worksheets #12-2 of the QAPP (Tierra 2014a). Conformance to laboratory duplicate frequency requirements, as well as acceptability of the resulting RPD values, were evaluated and considered during data validation. There are no limitations on data usage based on precision quality acceptance criteria (Tierra 2017)

Attachment A-3

DATA USABILITY WORKSHEET
Site: Newark Bay Study Area
Medium: Sediment and Porewater Chemistry, Toxicity Testing, And Benthic Invertebrate Community Analysis

Activity	Comment
Field Sampling	
Discuss sampling problems and field conditions that affect data useability.	Sediment, porewater, and benthic invertebrate community data were collected during the 2015 Sediment Quality Triad (SQT) program as described in the approved QAPP (Tierra 2015), the field report (GSH 2017a) and the data usability report (GSH 2017b). Sampling problems and field conditions did not affect data usability for the SQT program.
Are samples representative of receptor exposure for this medium (e.g. sample depth, grab vs composite, filtered vs unfiltered, low flow, etc.)?	Samples were representative of receptor exposure for each medium in accordance with the EPA approved QAPP (Tierra 2015). Sediment grab samples were collected from 43 stations over 13 days. SQT analyses (sediment chemistry, toxicity testing, and benthic invertebrate community analysis) and porewater chemistry analyses were conducted at 30 of these stations. Bioaccumulation tests were conducted at a subset of eight stations. In addition to the sediment grab samples, surface water was collected from one location in northern Newark Bay for use in the ex-situ porewater passive sampling study.
Assess the effect of field QC results on data useability.	During data validation activities, analytical data were evaluated in accordance with the verification/validation protocols specified in Worksheet #34, Worksheet #35, and Worksheet #36 of the QAPP (Tierra 2015). In addition, data validation qualifiers were consistently applied to the analytical data generated during the SQT program.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	Field sampling issues did not affect usability for risk assessment.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	Definitive analytical methods were selected in the EPA approved QAPP based on DUOs and DQOs, including risk assessment. See Worksheets #11 of the QAPP (Tierra 2015).

Were detection limits adequate?	Detection limits generally achieved the risk-based screening levels or Project Action Levels or were the best available using EPA approved analytical methods. See Worksheet #15-1 through #15-4 of the QAPP (Tierra 2015).
Summarize the effect of analytical technique issues on the risk assessment, if applicable.	All methods provided usable results for risk assessment.
Data Quality Objectives	
Precision - How were duplicates handled?	Acceptance criteria for field and laboratory duplicates are provided in Worksheet #12-2 through #12-4 of the QAPP (Tierra 2015). There are no limitations on data usage based on precision quality acceptance criteria (GSH 2017b).

Activity	Comment
Data Quality Objectives (continued)	
Accuracy - How were split samples handled?	Measurement performance criteria for accuracy/bias contamination are outlined in Worksheets #12-1 through #12-4 of the QAPP (Tierra 2015). Acceptability of quality control (QC) results for accuracy/bias contamination and conformance to field and laboratory QC sample frequency requirements were evaluated and considered during the data verification/validation. There are no limitations on the data usage based on accuracy/bias contamination acceptance criteria (GSH 2017b).
Representativeness - Indicate any problems associated with data representativeness (e.g., trip blank or rinsate blank contamination, chain of custody problems, etc.).	Representativeness is the degree to which a dataset accurately represents the characteristics of a population, parameter conditions at a sample point, or an environmental condition. Data are representative when all sampling and analyses are performed in compliance with appropriate procedures. Performing sample analyses within the specified holding times and adhering to sample handling and storage requirements are also critical elements in obtaining representative sample data. These elements were evaluated and considered during data verification/validation. Acceptance criteria for sample handling, storage and holding times are provided in Worksheets #19-1 through #19-4 of the QAPP (Tierra 2015). There are no limitations on the data usage based on representativeness acceptance criteria (GSH 2017b).
Completeness - Indicate any problems associated with data completeness (e.g., incorrect sample analysis, incomplete sample records, problems with field procedures, etc.).	The targeted field and analytical completeness goals were 90% for the SQT Program; these goals were met or exceeded. The total analytical completeness was obtained using the total sample results for porewater, sediment, and tissue minus the total amount of rejected results. The

	laboratory completed all analyses, but some data were rejected, causing the overall analytical completeness to be 96.4%. The analytical completeness achieved for porewater samples was 99.0%. The analytical completeness achieved for sediment samples was 95.1%. The analytical completeness for tissue samples was 97.5%. The total analytical completeness for all matrices analyzed is 96.4% (GSH 2017b).
Comparability - Indicate any problems associated with data comparability.	. Comparability expresses the confidence with which one set of data can be compared to another to measure the same property. Data can be compared to the degree that their accuracy, precision, and representativeness are known and documented. Data are comparable if QC measures such as collection techniques, measurement procedures, analytical methods, and reporting units are equivalent for the samples within a sample set. Data subject to established quality assurance/quality control (QA/QC) measures are deemed more reliable and, therefore, more comparable, than data generated without such measures. Consistent application of prescribed procedures was monitored throughout the SQT program. Likewise, specific data verification/validation protocols were consistently applied to all data generated under this program to understand and document accuracy/bias, accuracy/bias contamination, precision, sensitivity and representativeness, thereby establishing comparability. During data validation activities, analytical data were evaluated using a defined set of guidelines and acceptance criteria. In addition, data validation qualifiers were consistently applied to the analytical data generated during the SQT program. The data validation process serves to increase the degree of data comparability achieved. There are no limitations on the data usage based on comparability acceptance criteria (GSH 2017b).
Were the DQOs specified in the QAPP satisfied?	Yes
Summarize the effect of DQO issues on the risk assessment, if applicable.	None
Data Validation and Interpretation	
What are the data validation requirements?	Data validation requirements were defined in Appendix E of the QAPP (Tierra 2015).
What method or guidance was used to validate the data?	Data validation guidance and processes were included in Appendix E and Worksheets #34, #35, and #36 of the QAPP (Tierra 2015).

Field Sampling	
Discuss sampling problems and field conditions that affect data usability.	Sampling problems and field conditions did not significantly affect data usability for LPR RI/FS program.
Are samples representative of receptor exposure for this medium (e.g. sample depth, grab vs composite, filtered vs unfiltered, low flow, etc.)?	Samples were selected to be representative of each medium for contaminant nature and extent characterization in each EPA approved QAPP.
Assess the effect of field QC results on data usability.	Field QC sample results were evaluated during data validation and appropriate data qualifications were made per the governing EPA approved QAPPs.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	Field sampling issues did not affect the risk assessment.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	Definitive analytical methods were selected in each EPA approved QAPP based on DUOs and DQOs, including risk assessment. See Worksheets #11, 15, and 23 in the Section 9 referenced QAPPs.
Were detection limits adequate?	Detection limits generally achieved the risk based screening levels or Project Action Levels for each program, or were the best available using EPA approved analytical methods. See Worksheet #15 in the Section 9 referenced QAPPs. See sensitivity discussion in Section 4 of each Section 9 referenced Program Characterization Summary or RI report.
Summarize the effect of analytical technique issues on the risk assessment, if applicable.	LRC task analytical techniques that were insufficiently sensitive or selective, such as Aroclors by EPA Method 8082 and pesticides by EPA Method 8081 were not used in the BHHRA, in favor of the HRGC/HRMS methods for these analyte groups. All other methods provided usable results for risk assessment.
Data Quality Objectives	
Precision - How were duplicates handled?	Field duplicate results which exceeded precision criteria per the approved QAPPs were qualified per EPA validation guidance. See Worksheets #28 in the Section 9 referenced QAPPs and precision subsection in Section 4 of each Section 9 referenced Program Characterization Summary or RI report. See Section 3.2.1 of the draft BHHRA for the risk assessment treatment of duplicates.
Accuracy - How were split samples handled?	Split samples were evaluated by EPA and complete split sample results were not provided to the CPG. Limited split sample result problems

DATA USEABILITY WORKSHEET (continued)
Site: Lower Passaic River Study Area
Medium: Sediment and Surface Water

Activity	Comment
	presented by EPA resulted in data modifications. See comparability section below.
Representativeness - Indicate any problems associated with data representativeness (e.g., trip blank or rinsate blank contamination, chain of custody problems, etc.).	Sediment sample representativeness was impacted by aliquot size reduction (to the project minimum of 1g) required by high analyte concentrations for many organic analytes. High moisture content of many samples resulted in data qualification and may have impacted subsample representativeness. Seven percent of the SV CWCM program SVOC results were rejected due to holding time exceedance. See Section 4 of each referenced Program Characterization Summary or RI report.
Completeness - Indicate any problems associated with data completeness (e.g., incorrect sample analysis, incomplete sample records, problems with field procedures, etc.).	Completeness for each program was excellent and less than 1% of results were rejected as unusable. See Section 4 of each referenced Program Characterization Summary or RI report.
Comparability - Indicate any problems associated with data comparability.	Comparability was achieved by using the same EPA approved methods and same laboratories when possible throughout all the LPR programs. Data comparability for the 2008 LRC PCDD/PCDF analyses from the CAS-Houston laboratory was questioned by EPA based on split sample results. Adjustments to results were made in 2011 per EPA directive as explained in Section 2.11.4.3 of the LRC Characterization Summary. Original results were flagged F to indicate they were unusable per the EPA directive. The laboratory used for PCDD/PCDF analysis during the LRC was not used in subsequent programs and no further significant problems with split sample results were noted by EPA.
Were the DQOs specified in the QAPP satisfied?	Yes
Summarize the effect of DQO issues on the risk assessment, if applicable.	None
Data Validation and Interpretation	
What are the data validation requirements?	Data validation requirements were defined in Worksheets #34, 35, 36, and 37 of each program approved QAPP.
What method or guidance was used to validate the data?	Current EPA Region II data validation guidance, as detailed per Worksheet#36 in each program QAPP, was used to validate the data.
Was the data validation method consistent with guidance? Discuss any discrepancies.	Yes. If a Region II SOP was not available for a specific method, and SOP for a similar method was adopted for guidance. Validation criteria include professional judgment where appropriate and necessary.
Were all data qualifiers defined? Discuss those which were not.	Yes, all validation based data qualifiers were defined in the data validation memoranda, provided in the appendices to each program report.
Which qualifiers represent useable data?	All qualifiers except ‘R’ and ‘F’ represent usable

DATA USEABILITY WORKSHEET (continued)
Site: Lower Passaic River Study Area
Medium: Sediment and Surface Water

Activity	Comment
	data.
Which qualifiers represent unusable data?	The rejected (R flagged) and F flagged (see discussion under Comparability above) results were not considered usable per cited validation guidance and EPA directives.
How are tentatively identified compounds handled?	The accuracy of mass spectral identification for TICs was not verified during full or limited data validation. TICs were not quantitatively evaluated in the risk assessment.
Summarize the effect of data validation and interpretation issues on the risk assessment, if applicable.	An insignificant portion of data (<<1%) was excluded from risk assessment because it was unusable, therefore the impact was minimal. The impact of the increased concentration adjustments to PCDD/PCDF results from the 2008 LRC required by EPA's interpretation of the data may be significant.
Additional notes:	

Note: The purpose of this Worksheet is to succinctly summarize the data usability analysis and conclusions.

Notes:
1. Crab/Clam sampling stations 124 and 132B have not been included as they are not within the boundaries of shoreline segments identified as having human access in the NBSA shoreline access characterization map (Figure B6) of the NBSA Problem Formulation (June 2013).

[a] Identified in Table B1 of the NBSA Problem Formulation (June 2013).

[b] Identified in Figure 2-1 of the NJDEP Permit Submittal document dated February 26, 2015.

[c] Identified in Figure 1 of the NBSA Sediment Quality Triad and Porewater Sampling and Analysis (August 2015).

[d] Crab/Clam samples 123A and 123B, and SQT QAPP sample 136 provide data for the accessible shoreline areas near The Thomas M. Gerrity Athletic Complex.

[e] SQT QAPP sample 168 provides data for the recreational area near the NE corner of the Bay (just north of the parks in Bayonne).

[f] SQT QAPP sample 169 provides data for accessible shoreline areas near Richard A. Rutkowski Park.

[g] SQT QAPP sample 142 provides data for the beach-like area near Bayonne High School.

[h] SQT QAPP sample 170 is proposed to be collected near the northern shoreline area of the trailer park. As seen in Appendix B-7 of the NBSA Reconnaissance Survey Report (April 2015) and in Google Earth images of the trailer park shoreline it is dominated by riprap. SQT QAPP sample 170 is proposed to be collected in an area that is most accessible by humans.

[i] SQT QAPP sample 146 will not be used for the BHHRA due to its location on a transitional slope; a new sample closer to the shoreline will be added.

* = The sample location may not be within the exact segment boundary, however it is within a reasonable distance to be considered relevant and useful
(CC) = Community Commercial
(I) = Industrial
(KA) = Kapkowski Road Redevelopment Area
(M) = Manufacturing
(MRC) = Manufacturing, Research, Commercial
(R) = Residential
(RA) = Redevelopment Area
(WDD) = Waterfront Development District

Attachment A-6

These data are the sample weights of the tissue types from individual crabs collected September 10 and 11, 2014 from Newark Bay. Per Bryan at Normandeau, after this date the crab processing was modified, therefore tissue weights measured after that cannot be used to estimate fractional weights of each tissue type.

Final Fractional Averages computed from all data, no apparent outliers in the data set.

Abbreviations
ATSDR - Agency for Toxic Substances and Disease Registry, ca - based on carcinogenic effects, Carc - known human carcinogen, CAS - Chemical Abstracts Service number, DL - dioxin-like, FDA - Food and Drug Administration, HHRA - human health risk assessment, mg/kg - milligram per kilogram, NA - not applicable, nc - based on noncarcinogenic effects, NDL - non dioxin-like, PAH - polycyclic aromatic hydrocarbon, PCB - polychlorinated biphenyl, Ref - reference, RSL - regional screening level, SL - screening level, TEF - toxic equivalency factor, TPH - total petroleum hydrocarbon, µg/L - microgram per liter, USEPA - US Environmental Protection Agency

Notes
Fish tissue screening levels were calculated using the EPA RSL online calculator. Screening levels for carcinogens were calculated for adult exposure, assuming an ingestion rate of 54 g/d. Screening values for noncarcinogens were calculating for a child exposure, assuming an ingestion rate of 18 g/d.
The following EPA RSLs were used for cadmium: sediment (diet), surface water (water), tissue (diet).
The following EPA RSLs were used for manganese: sediment (non-diet), surface water (non-diet), tissue (diet).
Because of TPH metabolism, it is unlikely that a pattern match would be found in tissue. Therefore, tissue screening levels are considered not applicable for the TPH fractions.
Several chemicals have sediment and surface water screening levels, but no tissue screening level. These chemicals lack an oral toxicity factor, which is necessary for calculation of the tissue RSL. These chemicals include titanium, 4-methyl-2-pentanone, bromochloromethane, chloroethane, cyclohexane, methyl chloride, and methylcyclohexane.
The FDA action level for lead in crustacea (1.5 ppm) was used for the tissue screening level (FDA 2007).
USEPA's current residential RSL (USEPA 2019c) for lead in soil is 400 mg/kg, based on the regulatory target of no more than 5% of young children in a population having a blood-lead level exceeding 10 µg/dL. USEPA now recommends targeting blood lead levels below 10 µg/dL; in fact, USEPA (2017)

TABLE B-1.1
SCREENING LEVELS AND SURROGATES USED IN SELECTION OF COPCS
BASELINE HUMAN HEALTH RISK ASSESSMENT
NEWARK BAY STUDY AREA

Chemical	CAS	Sediment USEPA RSL - Soil (Risk of 10^{-6} or Hazard of 0.1) (mg/kg)	ca/nc	Surface Water USEPA RSL - Tap Water (Risk of 10^{-6} or Hazard of 0.1) (µg/L)	ca/nc	Tissue Screening Levels (Risk of 10^{-6} or Hazard of 0.1) (mg/kg)	ca/nc	Known Human Carcinogen	Surrogate	CAS for Surrogate	Rationale/Ref for Surrogate

recommends updates to lead methodologies and includes examples targeting a blood level of 5 µg/dL. Therefore, as recommended by USEPA and NJDEP (2019), 200 mg/kg is used as the screening level for lead in sediment.
Known Human Carcinogen designations are based on USEPA's weight of evidence classifications provided in USEPA (2019a, 2019b) and USEPA (2005).
USEPA RSLs are the May 2019 values (USEPA 2019c).

APPENDIX B-2
AGE DEPENDENT ADJUSTMENT FACTOR EVALUATION FOR TRICHLOROETHYLENE

B-2.1 Background

For carcinogens for which sufficient evidence exists to determine that a cancer occurs via a mutagenic mode of action, USEPA's Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens (USEPA 2005) recommends application of age-dependent adjustment factors (ADAFs) to account for potential early-life susceptibility to mutagens. In the absence of chemical-specific information regarding age-specific sensitivity, USEPA (2005) recommends use of default ADAFs (Age <2: ADAF = 10, Age 2<16: ADAF = 3, Age ≥16: ADAF = 1). Trichloroethylene (TCE) is classified by EPA as being carcinogenic to humans, potentially causing kidney and liver tumors, as well as non-Hodgkin lymphoma (NHL). Evidence indicates a mutagenic mode of action for kidney tumors, but not for liver tumors or NHL. Therefore, USEPA's Toxicological Review of TCE - Support of Summary Information on the Integrated Risk Information System (IRIS) (USEPA 2011) recommends that kidney risk be assessed using the mutagenic approach (ADAF applied), but liver and NHL be addressed using standard cancer equations.

USEPA generally recommends use of ADAFs when determining cancer risks for mutagenic carcinogens. However, since the ADAF adjustment applies only to the kidney cancer contribution to the total CSF for TCE, it is likely to have a very low influence on total cancer risk, except when exposures primarily occur during early life. USEPA states that, in the case of full lifetime calculations, excluding the ADAF adjustment altogether "will not seriously impact the resulting risk estimate" (USEPA 2011).

Per USEPA (2011), the TCE oral cancer slope factor (CSF) for kidney tumors, liver tumors and NHL (i.e., "total" CSF) is 0.046 $(mg/kg\text{-}day)^{-1}$ whereas the CSF for kidney tumors alone is 0.0093 $(mg/kg\text{-}day)^{-1}$. Subtracting the kidney CSF from the total CSF gives a CSF for NHL + liver tumors of 0.0367 $(mg/kg\text{-}day)^{-1}$. Therefore, if the approach recommended by USEPA (2011) is followed, the age-specific ADAF is applied to the kidney CSF, but not to the NHL + liver CSF.

Consistent with the Baseline Human Health Risk Assessment (BHHRA) for the Lower Passaic River Study Area (LPRSA) (AECOM 2017), the NBSA BHHRA uses default ADAFs for TCE. Specifically, the age-specific ADAFs are applied to the total lifetime oral CSF of 0.046 $(mg/kg\text{-}day)^{-1}$, instead of using the TCE-specific approach that applies the ADAF to the kidney CSF but not the NHL + liver CSF. The default approach is more stringent (yields higher cancer risks) than the TCE-specific approach discussed in USEPA (2011). Despite this additional conservatism, TCE is not a risk driver for the NBSA BHHRA.

B-2.2 Example Calculations

To illustrate this concept, Attachment B-2A depicts surface water ingestion and dermal calculations for an adult and child wader showing the difference in cancer risk resulting from application of the default ADAF approach vs. the TCE-specific approach outlined in USEPA (2011). Surface water was chosen for the example calculations, because TCE is a COPC in surface water only for the NBSA. As shown in Attachment B-2A, surface water ingestion risks are 2.3-fold higher using the default ADAF approach vs. the TCE-specific approach; surface water dermal risks are 1.7-fold higher using the default ADAF approach instead of the TCE-specific approach (the difference is due to relative differences in the exposure assumptions between children and adults for the surface water ingestion and dermal contact pathways). These example

calculations demonstrate that use of the default ADAF methodology for TCE is more stringent for assessing the carcinogenicity and mutagenicity for this chemical in the NBSA BHHRA.

Appendix C-1

APPENDIX C-1
SEDIMENT VOLATILIZATION SCREENING ASSESSMENT

C-1.1 Introduction

A screening assessment for the inhalation of volatile or semivolatile chemicals of potential concern (COPCs) from exposed Newark Bay Study Area (NBSA) sediments was conducted to determine whether this route of exposure should be included in the baseline human health risk assessment (BHHRA). Consistent with the BHHRA for the Lower Passaic River Study Area (LPRSA) (AECOM, 2017), inhalation screening levels for Newark Bay were developed using USEPA's *Soil Screening Guidance: User's Guide* (USEPA, 1996). These screening levels were then compared to upper-bound Newark Bay sediment concentrations to determine whether potentially elevated carcinogenic risk and noncarcinogenic hazards are present. The sediment volatilization screening assessment methods and results are described in the following sections.

C-1.2 Methods

The initial sediment screening assessment, detailed in Sections 3.3 and 3.4 of the main text of this BHHRA, identified 56 COPCs. Of these chemicals, 34 were classified as volatile according to the USEPA Regional Screening Levels (RSLs) (2018) and were evaluated further for volatilization as described in this Appendix.

C-1.2.1 Derivation of the Volatilization Factor

Screening levels were developed for these COPCs using a volatilization factor (VF) that characterizes volatile emissions from sediment and dispersion in ambient air. Specifically, VF was calculated using Equations 1a–c (USEPA, 1996):

$$VF = \frac{Q/C \times (3.14 \times D_A \times T)^{0.5} \times 10^{-4}}{2 \times \rho_b \times D_A} \quad (1a)$$

$$D_A = \frac{[(\theta_a^{\frac{10}{3}} \times D_i \times H' + \theta_w^{\frac{10}{3}} \times D_w)/ n^2]}{[(\rho_b \times K_d + \theta_w + \theta_a H')]} \quad (1b)$$

And for organics:

$$K_d = K_{oc} \times f_{oc} \quad (1c)$$

where:

VF	=	soil-to-air volatilization factor (m^3/kg)
Q/C	=	inverse of the mean concentration at the center of a source (g/m^2-s per kg/m^3)
D_A	=	apparent diffusivity (cm^2/s)
T	=	exposure interval (s)
ρ_b	=	dry soil bulk density (g/cm^3)
n	=	total soil porosity (L_{pore}/L_{soil})
θ_a	=	air-filled soil porosity (L_{air}/L_{soil})
θ_w	=	water-filled soil porosity (L_{water}/L_{soil})
D_i	=	diffusivity in air (cm^2/s) (chemical-specific)

D_w = diffusivity in water (cm^2/s) (chemical-specific)
H' = dimensionless Henry's law constant (chemical-specific)
K_d = soil-water partition coefficient (cm^3/g) (chemical-specific)
K_{oc} = soil organic carbon partition coefficient (cm^3/g) (chemical-specific)
f_{oc} = fraction organic carbon in soil (g/g).

The dispersion model term in the VF equation, Q/C, was defined as 54.5 g/m^2-s per kg/m^3. This value, obtained from Exhibit 11 of the *User's Guide* (USEPA, 1996), was based on the closest climate zone to Newark Bay (i.e., Philadelphia, PA) and an exposure area of 10 acres. To establish the largest individual sediment exposure area, polygons were created using Google Earth for each of the intertidal areas specified in the *Phase I and Phase II Sediment Deposition Report* (Tierra Solutions, 2011; Fig 2-2). These intertidal areas ranged from approximately 2.5 acres to 9.2 acres; therefore, a source exposure area of 10 acres was conservatively assumed in the calculation of the VF.

Parameters describing Newark Bay sediment were defined as shown in Table C-1.1. Many of these assumptions about NBSA sediment were consistent with the values employed in the LPRSA BHHRA Tier 2 evaluation of the sediment volatilization pathway (AECOM, 2017)—namely, particle density and all definitions of porosity (i.e., total, air, and water). Bulk density (ρ_b) was calculated using the total porosity and particle density specified in Table C-1.1. This value, 0.66 g/cm^3, was also found to be consistent with reported bulk density for the Passaic River and Navigation Channels of Newark Bay of 0.7 g/cm^3 (Tierra Solutions, 2011). The fraction of organic carbon in soil, f_{oc}, was assumed to be 0.0391, based on the mean detected total organic carbon (TOC) reported in Table 3-3 of *The SQT and Porewater Report for NBSA* (GSH, 2017).

Table C-1.1. Assumptions characterizing Newark Bay sediment

Parameter	Definition	Value	Reference
ρ_s	particle density (g/cm^3)	2.65	AECOM (2017); USEPA (1996) default
ρ_b	bulk density (g/cm^3)	0.66	Calculated from total porosity and particle density, given $n = 1-(\rho_b / \rho_s)$
n	total porosity (unitless)	0.75	AECOM (2017) — Tier 2 assumption
θ_a	air-filled porosity (unitless)	0.0850	AECOM (2017) — Tier 2 assumption
θ_w	water-filled porosity (unitless)	0.67	AECOM (2017) — Tier 2 assumption
f_{oc}	fraction organic carbon content (unitless)	0.0391	Glenn Springs Holdings (2017)

Chemical-specific parameters (i.e., diffusivities in air and water [D_i, D_w], organic carbon partition coefficients (K_{oc}), and dimensionless Henry's law constants (H')) were obtained from the following sources:

- EPA's site-specific regional screening levels (RSL) calculator (output generated December 2017)
- EPA's Water 9 (v3.0) database.

These physicochemical properties were generated at the site-specific temperature of 285 deg. K (11.85 deg. C) (AECOM, 2017). Otherwise, default parameters calculated at 298 deg. K (25 deg. C) were used. The

values for these chemical-specific parameters are included in Attachment C1-A. Finally, the default exposure interval, T, of 9.5×10^8 seconds was assumed to calculate VF (AECOM, 2017; USEPA, 1996).

C-1.2.2 Calculation of Screening Levels

Carcinogenic and noncarcinogenic screening levels (SLs) were then calculated using the VF, along with assumptions about exposure factors and toxicity reference values. Equation 2 shows the sediment screening level that is protective of the inhalation of carcinogenic volatile chemicals (USEPA, 1996).

$$SL_{carc} = \frac{TR \times AT \times 365}{EF \times ED \times URF \times 1000 \times \frac{1}{VF}} \quad (2)$$

where:

SL_{carc} = screening level for inhalation of carcinogenic volatile chemicals (mg/kg)
TR = target cancer risk (unitless)
AT = averaging time (yr)
EF = exposure frequency (d/yr)
ED = exposure duration (yr)
URF = inhalation unit risk factor ($m^3/\mu g$) (chemical-specific)
VF = soil-to-air volatilization factor (calculated using Equation 1) (m^3/kg).

Equation 3 shows the sediment screening level that is protective of the inhalation of noncarcinogenic volatile chemicals (USEPA, 1996).

$$SL_{noncarc} = \frac{THQ \times AT \times 365}{EF \times ED \times \left[\frac{1}{RfC} \times \frac{1}{VF}\right]} \quad (3)$$

where:

$SL_{noncarc}$= screening level for inhalation of noncarcinogenic volatile chemicals (mg/kg)
THQ = target hazard quotient (unitless)
AT = averaging time (yr)
EF = exposure frequency (d/yr)
ED = exposure duration (yr)
RfC = inhalation reference concentration (mg/m^3) (chemical-specific)
VF = soil-to-air volatilization factor (Equation 1).

The targets of excess cancer risk of 1×10^{-6} and hazard quotient of 1 were used to develop the inhalation screening levels. Table C-1.2 shows additional exposure assumptions used for SLs.

Table C-1.2. Exposure assumptions used in developing SLs

Parameter	Definition	Value	Reference
AT_c	averaging time, carcinogenic	70	AECOM (2017); USEPA (1996) default
AT_{nc}	averaging time, non-carcinogenic	26	AECOM (2017); USEPA (1996) default
EF	exposure frequency	350	AECOM (2017); USEPA (1996) default
ED	exposure duration	26	AECOM (2017); USEPA (1996) default

Chemical-specific toxicity factors (i.e., inhalation unit risk factors [IURs] and reference concentrations [RfCs]) were obtained from USEPA RSLs (2019). Toxicity factors for the individual dioxin-like congeners were calculated using the value for 2,3,7,8-TCDD and applying a toxic equivalency factor (TEF). Additionally, surrogates were specified for the following COPCs:

- Total non-DL PCBs: Aroclor 1254
- PHC as gasoline: Total petroleum hydrocarbons (aromatic low)
- TPH (C9-C40): Total petroleum hydrocarbons (aromatic medium).

SLs were then compared to the sediment exposure-point concentrations (EPCs) presented in Table 3-8 of the main report. Excess carcinogenic risk was calculated by taking the ratio of the EPC and SL_{carc} and multiplying by 1×10^{6}. The noncarcinogenic hazard quotient was calculated by taking the ratio of the EPC and the $SL_{noncarc}$.

C-1.3 Results

The results for the sediment screening evaluation are summarized in Table C-1.3. For each COPC in this table, sediment EPCs, VFs, toxicity reference values (i.e., RfC and URF), inhalation screening levels (i.e., $SL_{noncarc}$ and SL_{carc}), hazard quotient, and excess cancer risk are shown. The calculated maximum hazard quotient observed was 0.16 for TPH (C9-C40). The maximum excess cancer risk was calculated as 1.4×10^{-7} for KM TEQ DF. Overall, none of the COPCs were found to exceed the target risk of 1×10^{-6} or noncarcinogenic target hazard level of 1.0. Based on these results, the sediment volatilization pathway was excluded from the BHHRA.

Table C-1.3. Sediment volatilization screening assessment results

COPCs	EPC (mg/kg)	VF (m^3/kg)	RfC (mg/m^3)	URF (m^3/µg)	$SL_{noncarc}$ (mg/kg)	SL_{carc} (mg/kg)	Hazard Quotient	Excess Cancer Risk

Abbreviations: COPCs – concentration of potential concern
EPC – exposure point concentration
VF – volatilization factor
RfC – inhalation reference concentration
URF – inhalation unit risk factor
$SL_{noncarc}$ – inhalation noncarcinogenic screening level
SL_{carc} – inhalation carcinogenic screening level

While there is uncertainty associated with any model of volatilization from soil or sediment and subsequent air dispersion, the models used in this assessment are recommended by USEPA to derive screening levels for purposes of assessing the need for further evaluation. Accordingly, these models are intended to be protective of human health under most site conditions, and concentrations below the screening levels generally do not require further evaluation (USEPA, 1996). Further, the majority of the input parameters are consistent with USEPA (1996) generic default values and values employed in the LPRSA BHHRA Tier 2 evaluation of the sediment volatilization pathway (AECOM, 2017). One of the few site-specific input parameters is the size of the exposure area used to calculate VF. For purposes of this assessment, a source exposure area of 10 acres was assumed. This value is slightly larger (more health-protective) than the largest intertidal area identified from the *Phase I and Phase II Sediment Deposition Report*, which ranged

from approximately 2.5 acres to 9.2 acres (Tierra Solutions, 2011; Fig 2-2). Even considering these primarily default or otherwise health-protective assumptions, the highest estimated excess cancer risk and non-cancer hazard quotient are nearly an order of magnitude below the corresponding screening levels. Therefore, any uncertainty in the volatilization and air dispersion modeling is not expected to affect the conclusions of this evaluation.

Calculation of Risk and Hazard based on the following:
Dimensionless Henry's Constants are from the following sources: 1) @ 11.85 deg. C - Water 9 and 2) @ 25 deg. C - US EPA RSL calculator
The following chemical names were used in Water9: "DIOXIN" - 2,3,7,8-TCDD; "TETRACHLORODIBENZOFURAN(2,3,7,8)" - 2,3,7,8-TCDF; "'3,3',4,4' PCB" - PCB-77; "PCB AROCLOR 1254 (pentachlorobiphenyl)" - Total Non-DL PCBs; "BENZO(A)ANTHRACENE" - Benz(a)anthracene; "BENZENE" - PHC as gasoline; "2-METHYLNAPHTHALENE" - TPH (C9-C40)
Diffusivity in air and water based on EPA RSL calculator that adjusts to 11.85 deg C if calculable, else default to 25 deg C

Appendix C-2

APPENDIX C-2: SURFACE WATER VOLATILIZATION SCREENING ASSESSMENT

C-2.1 Introduction

The potential for exposure to volatile or semivolatile organic chemicals of potential concern (COPCs) in surface water via inhalation of vapors in ambient air was evaluated in a manner consistent with the baseline human health risk assessment for the Lower Passaic River Study Area (LPRSA) (AECOM, 2013, 2015). Specifically, volatilization of COPCs from surface water was evaluated using a tiered approach. The first tier was based on a very conservative model for estimating evaporation from surface water and dispersion into a simple box model. The resulting ambient air concentrations were compared to U.S. Environmental Protection Agency (EPA) regional screening levels (RSLs) for air, assuming a residential scenario. For those chemicals for which the Tier 1 air concentration exceeded the residential air RSL, the second tier was based on a more realistic model for estimating evaporation from surface water and screening-level air dispersion modeling. The methods and results for each tier are described in the following sections.

C-2.2 Tier 1 — Initial Screening

The initial screening assessment of the surface water volatilization pathway was based on a simple box model, which is based on the idea of a theoretically enclosed space over the area of interest. The model assumes that vapors enter the box because of evaporation from the surface water and are removed by the wind. Importantly, this model is very conservative for an area as large as Newark Bay, because it assumes that evaporating chemicals are uniformly mixed within the box, the box height is very small, the wind direction is continuously aligned with the long axis of the Bay, and the receptor is always located downwind of the source (i.e., the concentration in the box is estimated at the downwind edge of Newark Bay). COPCs included in this evaluation are chemicals detected in surface water samples that are considered volatile or semivolatile by EPA for the purpose of deriving RSLs.[1] The equations used to estimate the evaporation rate and resulting ambient air concentrations are provided below, including all input parameters. These equations are the same as those used in the LPRSA risk assessment (AECOM, 2013, 2015).

C-2.2.1 Evaporation Rate

The evaporation rate from surface water was estimated according to EPA's Risk Management Program Guidance for Offsite Consequence Analysis for estimating worst-case evaporation from a pool (EPA, 2009).

$$QR = 0.285 \times U^{0.78} \times MW^{2/3} \times L_b \times W_b \times VP \times T^{-1}$$ **Equation 1**[2]

Where:

QR	=	evaporation rate of COPC into the box (g/sec)
U	=	annual average surface wind speed (m/sec).
MW	=	molecular weight of COPC
L_b	=	along-wind dimension (length) of the box (m)
W_b	=	cross-wind dimension (width) of the box (m)

[1] https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables. Accessed June 2019.

[2] The precise form of this equation is taken from AECOM (2015), which is slightly different from the equation presented in EPA (2009) because of units.

VP = COPC partial pressure in water (mm Hg) = saturation vapor pressure of COPC (mm Hg) × COPC mole fraction × COPC activity coefficient.
T = annual average temperature (K).

The values for U and T were set at 4.5 m/sec and 285 K, respectively, based on long-term observations by the National Weather Service at Liberty International Airport in Newark, New Jersey (AECOM, 2015). The values for L_b and W_b were set at 10,000 and 1,500 m, respectively, based on the approximate dimensions of Newark Bay. Chemical-specific parameters (where relevant, at 285 K) were obtained from EPA's Water9 (v3.0) database.[3] Finally, the mole fraction for each COPC was based on the 95% upper confidence limit (UCL) on the mean concentration in surface water (otherwise referred to as the exposure-point concentration [EPC]).

C-2.2.2 Ambient Air Concentration

The concentration of each COPC in ambient air was then estimated according to the following equation:

$$C_{air} = QR \times 1000 \times [(U \times W_b \times H_b)]^{-1} \quad \textbf{Equation 2}$$

Where:

C_{air} = air concentration of COPC (mg/m^3)
QR = evaporation rate of COPC into the box (g/sec) [from Equation 1]
1000 = conversion factor (mg/g)
U = annual average surface wind speed (m/sec)
W_b = cross-wind dimension (width) of the box (m)
H_b = height of the box (m).

The values for U and W_b are as described above. The value for H_b was set at 2 m to approximate the height of the breathing zone. This latter assumption is extremely conservative for an area as large as Newark Bay, because vapors will disperse upward as they are carried by the wind across the 10,000-ft length of the Bay.

The estimated air concentrations were compared to EPA's residential air RSLs, which assume exposure 350 days per year for 30 years. COPCs with estimated air concentrations below their respective RSLs were not considered further; COPCs with estimated concentrations above their respective RSLs were evaluated further in Tier 2.

The results of the Tier 1 initial screening are presented in Table C-2.1, and the complete calculations are included in Attachment C-2A. As shown in the table, the estimated air concentrations for four COPCs exceeded their respective residential air RSLs (i.e., chloroform, naphthalene, dioxin-like polychlorinated biphenyls (PCBs), and trichloroethylene).

[3] https://www3.epa.gov/ttnchie1/software/water/water9_3/index.html. Accessed September 2017.

Table C-2.1. Results of Tier 1 — Initial Screening

Chemical	EPC (µg/L)	QR (g/sec)	Cair (mg/m^3)	Residential air RSL (mg/m^3)	Ratio of Cair to RSL
Benzanthracene	1.18E-02	1.70E-05	1.3E-06	1.7E-05	7.4E-02
Chloroform	1.20E-01	2.45E+00	1.8E-01	1.2E-04	1.5E+03
Naphthalene	3.55E-02	8.65E-02	6.4E-03	8.3E-05	7.7E+01
KM TEQ PCB[a]	1.09E-07	1.91E-07	1.4E-08	7.4E-11	1.9E+02
2,3,7,8-TCDD[b]	1.22E-06	4.96E-10	3.7E-11	7.4E-11	5.0E-01
2,3,7,8-TCDF[b]	4.76E-07	1.42E-13	1.0E-14	7.4E-10	1.4E-05
KM TEQ DF[b]	2.44E-06	6.59E-10	4.9E-11	7.4E-11	6.6E-01
Trichloroethylene	1.31E-01	5.94E+00	4.4E-01	4.8E-04	9.2E+02

EPC = exposure-point concentration; QR = evaporation rate; Cair = ambient air concentration; DF = dioxins and furans; DL = dioxin-like; KM = Kaplan Meier; RSL = regional screening level; PCB = polychlorinated biphenyl; TEQ = toxicity equivalent concentration; TCDD = tetrachlorodibenzo-p-dioxin; TCDF = tetrachlorodibenzo-p-furan

[a] Physical constants based on PCB-77 (the only dioxin-like PCB in Water9 database.

[b] Physical constants based on values from AECOM Table D-2 (2015)

C-2.3 Tier 2 — Screening-Level Air Modeling

This second assessment of the surface water modeling pathway was based on a more realistic model for estimating evaporation from surface water and a screening-level air dispersion model, rather than the simple box model used in the initial screening assessment. The resulting ambient air concentrations were again compared to residential air RSLs. The equations used to estimate the evaporation rate are provided below, including all input parameters. These equations are the same as those used in the LPRSA risk assessment (AECOM, 2013, 2015). EPA's screening-level air dispersion model AERSCREEN was used to estimate the resulting ambient air concentration. AERSCREEN is the successor model to EPA's previous screening-level model SCREEN3, which was used in the LPRSA risk assessment. AERSCREEN has been EPA's recommended screening-level air dispersion model since its release in 2011 (EPA, 2011).

C-2.3.1 Evaporation Rate

In this tier, the evaporation rate from surface water was estimated according to EPA's model for estimating evaporation from lagoons and surface impoundments (EPA, 1993). Chemical-specific parameters (at 285 K, when relevant) were again obtained from EPA's Water9 (v3.0) database. These parameters were used to estimate evaporation rates for each COPC (termed emission rate by EPA [1993]) using the following equations.

Evaporation rate

$$ER = K \times C \times SA \times 0.01 \qquad \textbf{Equation 3}$$

Where:

ER	=	evaporation rate (g/s)
K	=	overall mass transfer coefficient [MTC] (cm/s)
C	=	COPC liquid phase concentration (mg/L)
SA	=	surface area of source (m^2)
0.01	=	conversion factor ($g/mg \times L/cm^3 \times cm^2/m^2$).

For purposes of this analysis, the area of Newark Bay was assumed to be the same as assumed above for the box model (i.e., 10,000 m × 1,500 m or 15,000,000 m^2). The remaining parameters are calculated as described in the following equations.

Overall MTC

$$1/K = 1/k_L + (R \times T)/(H \times k_G) \quad \textbf{Equation 4}$$

Where:

K	=	Overall MTC (cm/s)
k_L	=	COPC liquid phase MTC (cm/s)
R	=	Ideal gas constant (8.2×10^{-5} atm-m^3/mol-K)
T	=	absolute temperature (K)
H	=	COPC Henry's Law Constant (atm-m^3/mol)
k_G	=	COPC gas phase MTC (cm/s).

The value for T was again set at 285 K. Chemical-specific Henry's Law constants at 285 K (and other chemical-specific parameters, unless otherwise specified) were obtained from EPA's Water9 database.[4]

Liquid-Phase MTC

EPA (1993) provides two equations for calculating the liquid-phase MTC, depending on wind speed.

For wind speeds > 3.25 m/s (7 mph):

$$k_L = (32/MW)^{0.5} \times (T/298) \times (k_{L\text{-}O2}) \quad \textbf{Equation 5}$$

Where:

k_L	=	liquid phase MTC (cm/s)
32	=	MW of O_2 (g/mol)
T	=	temperature (K)
MW	=	COPC molecular weight (g/mol)
$k_{L\text{-}O2}$	=	liquid-phase MTC of O_2 (0.00013 cm/s; Mölder et al., 2005).

For wind speeds < 3.25 m/s (7 mph):

$$k_L = 2.78\times10^{-4} \times (Dw / 8.5\times10^{-6})^{0.667} \quad \textbf{Equation 6}$$

Where:

k_L	=	liquid-phase MTC (cm/s)
Dw	=	COPC diffusivity in water (cm^2/s)
8.5×10^{-6}	=	empirical factor (cm^2/s).

In Tier 1, the wind speed was set at 4.5 m/sec based on long-term measurements collected at Newark Liberty International Airport. Under this assumption, Equation 5 would be used to calculate the liquid-phase MTC. However, Equation 6 was used because it provided a more conservative (larger) value for the MTC. Furthermore, the fundamental relationship of MTC to wind speed is not linear, and using a linearly averaged

[4] The chemical-specific parameters for dioxin-like PCBs and non-dioxin-like PCBs were taken from EPA's physical parameter table used for deriving RSLs.

wind speed to calculate MTC is not necessarily appropriate. Therefore, the more conservative approach (Equation 6) was used.

Gas Phase MTC

$$k_G = 0.482 \times U^{0.78} \times Sc_G^{-0.67} \times d_e^{-0.11}$$ **Equation 7**

Where:

k_G	=	gas-phase MTC (cm/s)
0.482	=	empirical constant (cm/s × (m/s)$^{-0.78}$ × m$^{0.11}$)
U	=	wind speed (m/s)
Sc_G	=	gas side Schmidt number (unitless)
d_e	=	effective diameter of source (m).

Consistent with Tier 1, the value for U was set at 4.5 m/sec. The value for d_e was set at the assumed length of Newark Bay (i.e., 10,000 m).

Schmidt Number

$$Sc_G = \mu_G / (\rho_G \times D_a)$$ **Equation 8**

Where:

Sc_G	=	Schmidt No. (unitless)
μ_G	=	viscosity of air (0.00017734 g/cm-sec)
ρ_G	=	density of air (0.0012 g/cm^3)
D_a	=	COPC diffusivity in air (cm^2/s).

C-2.3.2 Ambient Air Concentration

Ambient air concentrations were estimated using EPA's current screening-level air dispersion model AERSCREEN (version 16216) (EPA, 2016). For this assessment, Newark Bay was modeled as a 1,500- by 9,999-m area source, which is essentially the same dimensions as used in Tier 1.[5] For area sources, AERSCREEN evaluates winds blowing along the long axis of the source to determine maximum ambient air concentrations. AERSCREEN also located the area source, so that the origin of the modeling grid (x-y coordinates 0, 0) is at the center of the source. This source was also assumed to have an initial vertical dimension of 0.5 m to account for fluctuations along the water surface due to wind, shipping, etc. The model was conducted over simple terrain, which assumes that the source and receptors had elevations of zero (i.e., at ground level).

The AERSCREEN model was run in URBAN mode for estimating vertical and lateral dispersion. A default emission rate of 1 gram per second (g/s) was used for the entire area of Newark Bay. Because the emissions accumulate as the wind flows along the long axis, maximum impacts occurred at the downwind edge of the area source. Therefore, a line of receptors along the wind vector and parallel to the long axis of the source began at 5,000 m (approximate edge of the area source measured from the origin at its center) and extended to 20,000 m. A flagpole height of 2 m was used for all receptors, consistent with Tier 1.

[5] The upper-bound limit for source length in AERSCREEN is 9,999 m, which is approximately equal to the assumed length of Newark Bay of 10,000 m used in Tier 1.

Screening meteorological data were generated by the MAKEMET program (version 16216). Inputs for generating these data included:

- Minimum / maximum temperatures: 257.0 / 310.0 K (based on historical data for Newark Bay; NRCC, 2017)
- Minimum wind speed: 0.5 meters per second (m/s)[6]
- Anemometer height: 10 m
- Surface profile: Urban
- Climate: Average moisture for temperate climate.[7]

From these data, MAKEMET generated 498 hourly meteorological conditions that included variable wind speeds (between 0.5 and 18 m/s), temperatures, mixing heights, and dispersion parameters. These were then used to determine the maximum 1-hour ambient concentration. Finally, an averaging period factor for annual conditions (0.1; EPA 2016) was multiplied by the maximum 1-hour concentration to estimate annual average ambient concentrations for a 1-g/s source.

The annual average concentrations predicted by the air dispersion modeling were multiplied by the chemical-specific evaporation rates (Equation 3) to estimate chemical-specific ambient air concentrations related to evaporation from Newark Bay.

The results of the Tier 2 assessment are presented in Table C-2.2, and the complete calculations and AERSCREEN output are included in Attachment C-2B. As shown in the table, the estimated annual average air concentrations for all four COPCs were below their respective residential air RSLs, by at least an order of magnitude. Accordingly, the surface water volatilization pathway was not included in the quantitative risk assessment.

Table C-2.2. Results of Tier 2 – Screening-level air modeling

Chemical	EPC (µg/L)	ER (g/sec)	Cair (mg/m^3)	Residential air RSL (mg/m^3)	Ratio of Cair to RSL
Chloroform	1.20E-01	5.36E-03	5.5E-06	1.2E-04	4.6E-02
Naphthalene	3.55E-02	1.26E-03	1.3E-06	8.3E-05	1.6E-02
KM TEQ PCB	1.09E-07	1.04E-09	1.1E-12	7.4E-11	1.5E-02
Trichloroethylene	1.31E-01	5.53E-03	5.7E-06	4.8E-04	1.2E-02

DL = dioxin-like; Cair = ambient air concentration; EPC = exposure point concentration; ER = evaporation rate; KM = Kaplan Meier; PCB = polychlorinated biphenyl; RSL = regional screening level; TEQ = toxicity equivalent

[a] Physical constants based on PCB-77 (the only dioxin-like PCB in Water9 database.

[b] Physical constants based on values from AECOM Table D-2 (2015); RSL based on PCBs-low risk, consistent with AECOM, 2015.

It is important to note that there is uncertainty associated with any model of volatilization from surface water and subsequent air dispersion. The model used to estimate volatilization in the initial Tier 1 assessment is recommended by EPA to assess worst-case evaporation from a pool (EPA, 2009), and the chemicals were assumed to volatilize into a theoretically enclosed space above the entire area of Newark Bay. Even based on these conservative assumptions, the estimated air concentrations of only four COPCs were above their

[6] Although the evaporation rate was calculated based on a higher assumed wind speed, AERSCREEN was run with the default minimum wind speed, which results in higher (more conservative) estimated ambient air concentrations.

[7] Choices are moist (rain forest), average (temperate), and dry (desert).

respective EPA residential air RSLs. In Tier 2, a more realistic volatilization model recommended by EPA for evaluating evaporation from lagoons and surface impoundments was used (EPA, 1993). This model estimated emission rates that were approximately two to three orders of magnitude lower than the worst-case model used in Tier 1. Air concentrations were then estimated using EPA's currently recommend screening-level air dispersion model. Despite the screening-level nature of the model, the estimate air concentrations were more than an order of magnitude lower than the EPA air residential RSLs. Therefore, any uncertainty in the volatilization and air dispersion modeling is not expected to affect the conclusions of this evaluation.

(a) For individual dioxin and furan congeners, EPA RSL table did not list individual RSL values for each congener. In this table, RSL values are the RSL for 2,3,7,8-TCDD divided by the WHO 2005 TEF for each congener. For individual dioxin-like PCBs, the EPA RSL table listed individual RSL values, which are used in this table.

(a) Dispersion factor from AERSCREEN based on a unit emission rate is 1.031 ug/m3 per g/sec (see Table C-2B-2).
(b) For KM TEQ PCB, values were used from the Water9 entry for "3,3',4,4' PCB" (i.e., PCB 77). The RSL is for 2,3,7,8-TCDD.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% H-UCL 0.00473

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Adjusted Gamma UCL 0.00324

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

PCB-169

General Statistics

Total Number of Observations	39	Number of Distinct Observations	36
Number of Detects	0	Number of Non-Detects	39
Number of Distinct Detects	0	Number of Distinct Non-Detects	36

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable PCB-169 was not processed!

95% H-UCL 2.0042E-5

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use

95% H-UCL 1.506

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	1.898

97.5% Chebyshev(Mean, Sd) UCL	15846	99% Chebyshev(Mean, Sd) UCL	18849

Suggested UCL to Use

95% Student's-t UCL	12150	or 95% Modified-t UCL	12169
or 95% H-UCL	12368		

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Mean (detects)	1.207		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	1.177

Mean (detects)	3.7		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)
For such situations, GROS method may yield incorrect values of UCLs and BTVs
This is especially true when the sample size is small.
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% H-UCL 245.9

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 1.224

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

95% KM Approximate Gamma UCL	64.78	95% GROS Approximate Gamma UCL	64.89

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

DL/2 is not a recommended method, provided for comparisons and historical reasons

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Lognormal Distributed at 5% Significance Level

Suggested UCL to Use

KM H-UCL	10.17

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

1,2,3,4,7,8-HxCDD

General Statistics

Total Number of Observations	112	Number of Distinct Observations	90
Number of Detects	0	Number of Non-Detects	112
Number of Distinct Detects	0	Number of Distinct Non-Detects	90

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 1,2,3,4,7,8-HxCDD was not processed!

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

95% KM Approximate Gamma UCL	0.674	95% GROS Approximate Gamma UCL	0.318

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	3.228

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

nu hat (MLE)	220.1	nu star (bias corrected)	174.3
Mean (detects)	760714		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL	69101960	or 95% Modified-t UCL	69133507
or 95% H-UCL	69513260		

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% Student's-t UCL 1.2924E-6

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% Adjusted Gamma UCL 3.1654E-6

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 1.1398E-7

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Mean (detects)	1.8838E-5		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Mean (detects)	2.2510E-4		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	1.3400E-5	Mean	0.0077

Number of Distinct Detects	0	Number of Distinct Non-Detects	4

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Dibenzo(a,h)anthracene was not processed!

Indeno(1,2,3-cd)pyrene

Suggested UCL to Use

95% H-UCL 0.00174

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use

95% Student's-t UCL	1.187	or 95% Modified-t UCL	1.191
or 95% H-UCL	1.206		

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Suggested UCL to Use

95% Student's-t UCL	1.068	or 95% Modified-t UCL	1.072
or 95% H-UCL	1.086		

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Cadmium

General Statistics

Total Number of Observations	18	Number of Distinct Observations	10
Number of Detects	0	Number of Non-Detects	18
Number of Distinct Detects	0	Number of Distinct Non-Detects	10

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!
Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Cadmium was not processed!

Chromium

General Statistics

Total Number of Observations	18	Number of Distinct Observations	11
Number of Detects	1	Number of Non-Detects	17
Number of Distinct Detects	1	Number of Distinct Non-Detects	10

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!
It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Chromium was not processed!

Cobalt

Suggested UCL to Use

95% KM (t) UCL	0.023

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 7.2682E-8

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Mean (detects)	2.3611E-5		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	4.5300E-6	Mean	0.00446

nu hat (MLE)	395.1	nu star (bias corrected)	100.1
Mean (detects)	2.2300E-6		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	1.7200E-6	Mean	0.00778
Maximum	0.01	Median	0.01

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use

95% Student's-t UCL 0.00103

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

nu hat (MLE)	54.39	nu star (bias corrected)	45.52
Mean (detects)	1.3191E-4		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	3.4100E-5	Mean	0.00123

Suggested UCL to Use

95% H-UCL 0.0205

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	6.4400E-5	Mean	6.6202E-4

Suggested UCL to Use

95% KM Adjusted Gamma UCL	1.3321E-4	95% GROS Adjusted Gamma UCL	0.00154

Warning: Recommended UCL exceeds the maximum observation

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma GOF Tests on Detected Observations Only

A-D Test Statistic	0.402	**Anderson-Darling GOF Test**
5% A-D Critical Value	0.698	Detected data appear Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.26	**Kolmogorov-Smirnov GOF**
5% K-S Critical Value	0.333	Detected data appear Gamma Distributed at 5% Significance Level

Detected data appear Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only

k hat (MLE)	8.249	k star (bias corrected MLE)	4.236
Theta hat (MLE)	0.83	Theta star (bias corrected MLE)	1.616
nu hat (MLE)	98.99	nu star (bias corrected)	50.83
Mean (detects)	6.843		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.157	Mean	3.341
Maximum	12.3	Median	2.059
SD	3.143	CV	0.941
k hat (MLE)	1.014	k star (bias corrected MLE)	0.882
Theta hat (MLE)	3.297	Theta star (bias corrected MLE)	3.79

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

97.5% Chebyshev(Mean, Sd) UCL	0.41	99% Chebyshev(Mean, Sd) UCL	0.479

Suggested UCL to Use

95% Student's-t UCL 0.326

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% H-UCL 3.0152E-6

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Normal Distributed at 5% Significance Level

Suggested UCL to Use

95% KM (t) UCL 9.8203E-8

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Data Not Gamma Distributed at 5% Significance Level

Gamma Statistics

k hat (MLE)	0.726	k star (bias corrected MLE)	0.642
Theta hat (MLE)	1.0054E-5	Theta star (bias corrected MLE)	1.1369E-5
nu hat (MLE)	26.15	nu star (bias corrected)	23.12
MLE Mean (bias corrected)	7.3028E-6	MLE Sd (bias corrected)	9.1120E-6
		Approximate Chi Square Value (0.05)	13.18
Adjusted Level of Significance	0.0357	Adjusted Chi Square Value	12.47

Assuming Gamma Distribution

95% Approximate Gamma UCL (use when n>=50))	1.2808E-5	95% Adjusted Gamma UCL (use when n<50)	1.3546E-5

Lognormal GOF Test

Shapiro Wilk Test Statistic	0.929	**Shapiro Wilk Lognormal GOF Test**
5% Shapiro Wilk Critical Value	0.897	Data appear Lognormal at 5% Significance Level
Lilliefors Test Statistic	0.171	**Lilliefors Lognormal GOF Test**
5% Lilliefors Critical Value	0.202	Data appear Lognormal at 5% Significance Level

Data appear Lognormal at 5% Significance Level

Lognormal Statistics

Minimum of Logged Data	-14.7	Mean of logged Data	-12.66
Maximum of Logged Data	-10.13	SD of logged Data	1.226

Assuming Lognormal Distribution

95% H-UCL	1.6430E-5	90% Chebyshev (MVUE) UCL	1.2614E-5
95% Chebyshev (MVUE) UCL	1.5458E-5	97.5% Chebyshev (MVUE) UCL	1.9406E-5
99% Chebyshev (MVUE) UCL	2.7161E-5		

Nonparametric Distribution Free UCL Statistics

Data appear to follow a Discernible Distribution at 5% Significance Level

Nonparametric Distribution Free UCLs

95% CLT UCL	1.1876E-5	95% Jackknife UCL	1.2140E-5
95% Standard Bootstrap UCL	1.1747E-5	95% Bootstrap-t UCL	1.9868E-5

95% Hall's Bootstrap UCL	1.4290E-5	95% Percentile Bootstrap UCL	1.2198E-5
95% BCA Bootstrap UCL	1.3757E-5		
90% Chebyshev(Mean, Sd) UCL	1.5644E-5	95% Chebyshev(Mean, Sd) UCL	1.9423E-5
97.5% Chebyshev(Mean, Sd) UCL	2.4667E-5	99% Chebyshev(Mean, Sd) UCL	3.4969E-5

Suggested UCL to Use

95% Chebyshev (Mean, Sd) UCL 1.9423E-5

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.17/11/18 5:10:03 PM
From File	fsh10_ndl_PCB_sum_wide2_flag_sep1_SB.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Total Non-DL PCBs

General Statistics

Total Number of Observations	18	Number of Distinct Observations	18
		Number of Missing Observations	0
Minimum	0.0836	Mean	0.317
Maximum	1.6	Median	0.184
SD	0.382	Std. Error of Mean	0.0901
Coefficient of Variation	1.207	Skewness	2.739

Normal GOF Test

Shapiro Wilk Test Statistic	0.59	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.897	Data Not Normal at 5% Significance Level
Lilliefors Test Statistic	0.382	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.202	Data Not Normal at 5% Significance Level

Data Not Normal at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	0.474	95% Adjusted-CLT UCL (Chen-1995)	0.527
		95% Modified-t UCL (Johnson-1978)	0.483

Gamma GOF Test

A-D Test Statistic	1.648	**Anderson-Darling Gamma GOF Test**
5% A-D Critical Value	0.757	Data Not Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.296	**Kolmogorov-Smirnov Gamma GOF Test**
5% K-S Critical Value	0.207	Data Not Gamma Distributed at 5% Significance Level

Data Not Gamma Distributed at 5% Significance Level
